MP HUSKY
CABLE TRAY & CABLE BUS™

CABLE TRAY SYSTEMS

Engineered to Support Powerful Reputations

MP Husky was founded in 1952 and originally began operations as Husky Products. Over the following 50+ years of leadership and service, MP Husky has gone through several transformations and mergers, including Husky/Burndy and Metal Products, thus leading to what is today MP Husky—**America's leading manufacturer of Cable Tray and Cable Bus Power Distribution Systems.**

Throughout these changes, one thing has remained constant—the “Husky” drive to be the most reliable, highest quality, cost effective and innovative manufacturer of Cable Support Systems and Cable Bus Power Distribution Systems. We have an unsurpassed commitment to customer satisfaction and service, and we are eager to earn your loyalty and trust. As we continue to build and strengthen our partnerships with our customers, we look forward to the next years of service and support.

Introduction

Decade after decade, for nearly 60 years, MP Husky continues to be the trusted and proven name in Cable Tray. With more systems installed in more industries and environments than any other manufacturer, you can rest assured MP Husky has the experience and capability to meet your most demanding requirements. As we begin another decade, MP Husky is stronger than ever and positioned to lead the industry with the latest innovations, eco-friendly products, and engineering and manufacturing technologies. Our focus continues to remain on providing unmatched customer support, investing in our people, protecting the environment, and providing the most technologically advanced and engineered systems.

MP Husky - Engineered to Support Powerful Reputations.

Description and Selection

Cable Tray systems provide rigid structural support for cables in a variety of commercial and industrial applications. The basic styles of cable tray are: Ladder, Trough, Center Rail, Wire Basket and Channel. For a more comprehensive description of the construction and utilization of these types of tray, turn to Sections 2, 3, 4, 5, 6, 7, 8, 9, 14, 15 and 16 in this catalog.

Husky Ladder

Ladder consists of two longitudinal side members connected by individual traverse members. It is intended for use primarily for power cable or control cable support and excels in heavy loading and longer span applications. It is available in I-Beam, Flange-In and Flange-Out designs.

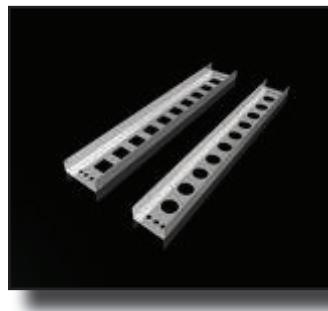

Husky Trough

Trough has a corrugated solid or ventilated bottom, 4" rung spacing or flat bottom pan design which is contained within longitudinal side members. It is especially appropriate for control and instrumentation cables.

Husky Channel

Channel is a one piece support with either ventilated or solid bottom sections. These sections are used with power cables, multiple control, or signal circuit cables.

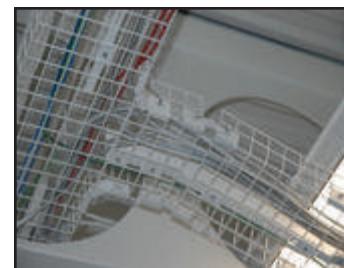

Technical Information

Description and Selection

Husky Wire Basket

Techtray is a wire mesh cable tray system that utilizes high mechanical strength steel wire that is welded into a 2" x 2" grid system. Typically used to carry data communication and fiber optic cables, with a high degree of flexibility during installation due to capability and ease of fabricating fittings in the field.

Husky Pan Tray

Husky Way straight sections are one piece formed pan that provides a smooth flat bottom and a fill depth that is almost the same as the outside height of the tray. With a cover it provides complete protection of your cables. (Cover sold separately)

Husky EMI Tray is another option available to our customers (See Section 8 of this catalog).

Since Cable Tray is used in a wide variety of applications and under widely varying conditions, it is important that you gain an understanding of material specifications and structural design and apply that knowledge when selecting trays and specifying fittings, parts, and accessories. Some of the considerations are:

1. NEMA Class / CSA Class

Using the charts on the next page, determine the correct class of tray as it relates to your desired loading capacity per foot and support span. You will also need to know the weight of the cable and at what span it will be supported.

2. Material

MP Husky cable tray is available in aluminum, stainless steel and hot dip galvanized after fabrication or pre-galvanized steel, zinc plated, galvannealed and fiberglass.

3. Tray Depth

A loading depth from 2" to 10" is available, this varies by tray type.

4. Tray Width

Standard widths are 6", 9", 12", 18", 24", 30" and 36". (Many other widths available on Wire Basket Tray)

5. Tray Type

Nine types of tray are available: Ladder, Trough, Channel, I-Beam, Center Spline, Fiberglass, Pan Tray, EMI and Wire Mesh. Ladder is available with either 6", 9", 12" or 18" rung spacing. Both Channel and Trough are available with either solid, non-ventilated or ventilated bottoms.

6. Radius of Fittings

All fittings normally come with a 12", 24" or 36" radius in styles and material to match any tray selection.

Technical Information

Description and Selection

NEMA LOAD CLASSIFICATION

The National Electrical Manufacturers Association (NEMA) has standardized the classification of cable tray based on the load to be carried per foot, and the distance between span supports. The load per foot should include not only the cable, but additional load factors for wind, snow, ice, etc. For more information on loading, see page 14 in this section.

| NEMA CLASS | SUPPORT SPAN (feet/meters) | LOAD (lbs./ft.) / (kg/m) |
|------------|-------------------------------|-----------------------------|
| 5AA | 5/1.5 | 25/37 |
| 5A | 5/1.5 | 50/74 |
| 8AA | 8/2.4 | 25/37 |
| 8A | 8/2.4 | 50/74 |
| 8B | 8/2.4 | 75/112 |
| 8C | 8/2.4 | 100/149 |
| 10AA | 10/3.0 | 25/37 |
| 10A | 10/3.0 | 50/74 |
| 12AA | 12/3.7 | 25/37 |
| 12A | 12/3.7 | 50/74 |
| 12B | 12/3.7 | 75/112 |
| 12C | 12/3.7 | 100/149 |
| 16A | 16/4.9 | 50/74 |
| 16B | 16/4.9 | 75/112 |
| 20AA | 20/6.0 | 25/37 |
| 20A | 20/6.0 | 50/74 |
| 20B | 20/6.0 | 75/112 |
| 20C | 20/6.0 | 100/149 |

MP Husky manufactures Cable Tray in accordance with the latest NEMA Standards Publication VE1 and CSA Standard C22.2 No. 126.1

CSA LOAD CLASSIFICATION

| Maximum Design Load for Maximum Associated Support Spacing | | | | |
|--|-------------|---------|------------------------|--------|
| Class | Design Load | | Design Support Spacing | |
| | lbs./ft. | kg/m | Feet | Meters |
| A | 25 | 37kg/m | 10 | 3m |
| C | 65 | 97kg/m | 10 | 3m |
| D | 120 | 179kg/m | 10 | 3m |
| D | 45 | 67kg/m | 20 | 6m |
| E | 200 | 299kg/m | 10 | 3m |
| E | 75 | 112kg/m | 20 | 6m |

MP Husky is a charter member of NEMA and the Cable Tray Institute.

Our Quality Policy

At MP Husky we are committed to producing only the highest quality products that meet or exceed our customers' expectations and requirements. Our goal is to achieve 100% customer satisfaction by delivering the best products and services on time and defect free. We will achieve this individually and corporately through tested and proven processes and controls, in our Quality System, and with a constant focus and effort on continuous improvement.

Nuclear Program

MP Husky is audited in conformance with 10 CFR50 Appendix B - Nuclear Standards by the U.S. Nuclear Regulatory Commission. Appendix B to Part 50--Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants - This appendix establishes quality assurance requirements for the design, manufacture, construction, and operation of those structures, systems, and components. The pertinent requirements of this appendix apply to all activities affecting the safety related functions of those structures, systems, and components; these activities include designing, purchasing, fabricating, handling, shipping, storing, cleaning, erecting, installing, inspecting, testing, operating, maintaining, repairing, refueling, and modifying.

- We have and continue to serve over thirty Nuclear plants around the world.
- MP Husky has been compliant for over 45 years.
- We are the ONLY Cable Tray manufacturer to be 10CFR50 Appendix B compliant.
- We are audited every three years by members of the Nuclear Procurement Issues Committee using the Nuclear Procurement Issues Committee Audit Checklist (NUPIC Audit Checklist).
- The scope of the audit is to ensure that our Quality Assurance Program (QAP) is compliant with ANSI N45.2 and 10CFR50 Appendix B.

Materials & Construction

Cable tray systems are commonly fabricated from a corrosion-resistant metal or from a metal with a corrosion-resistant finish. The selection of the proper material is essentially an economic consideration.

Every cable tray installation places requirements on the mechanical properties of the material from which it is fabricated. These properties influence the spacing frequency of supporting members, and the ease of installation. The selection of the material may also be dependent upon electrical (conductivity), physical (appearance), or chemical (corrosion resistance) properties, according to the demands of the specific installation. Although there are numerous metals available which could satisfy the basic requirements, certain wrought aluminum alloys and low carbon steels meet these requirements most economically.

Wrought Aluminum Alloys

Pure aluminum is soft and ductile. However, most commercial uses require greater strength than pure aluminum affords. This strength is achieved by the addition of other elements to produce alloys which singly, or in combination, impart strength to the metal. These alloys have been classified into seven categories according to their chemical composition, and have been given numerical designations for each series of alloys of 1000 through 7000 by the Aluminum Assoc. In addition to alloying the pure aluminum, further strengthening is possible by heat treating.

Heat-Treatable Alloys—the initial strength of alloys in this group is enhanced by the addition of such alloying elements as copper, magnesium, zinc and silicon, and are designated as 2000, 6000, and 7000 series. Since these alloys singly, or in various combinations, show increasing solid solubility in aluminum with increasing temperature, it is possible to subject them to thermal treatments which will impart pronounced strengthening.

Non-Heat-Treatable Alloys—the initial strength of alloys in this group depends upon the hardening effect of elements such as manganese, silicon, iron and magnesium, singly or in various combinations.

The non-heat treatable alloys are designated as 1000, 3000, 4000, and 5000 series. As these alloys are work-hardenable, further strengthening is made possible by various degrees of cold working, denoted by the "H" series of tempers. Alloys containing appreciable amounts of magnesium when supplied in strain-hardened tempers are usually given a final elevated temperature "stabilizing" to insure stability of properties.

In determining the proper aluminum alloy for structural applications, such as ventilated cable tray systems, the design engineer should recognize the advantages inherent in using alloys that are heat-treatable and of being able to fabricate the structure from materials possessing known minimum values of yield strength.

Cable tray products are most widely formed from the 6000 series alloys. Alloys in this group contain silicon and magnesium in approximate proportions to form magnesium silicide, thus making them capable of being heat-treated. Major alloys in this series are 6061 and 6063, which are among the most versatile of the heat-treatable alloys. Though not as strong as most 2000 or 7000 alloys, the magnesium-silicon (or magnesium silicide) alloys possess good formability and corrosion resistance.

Basic structural members of aluminum cable tray systems can be made from 6063-T6 aluminum extrusions, a material which economically meets the requirements of the majority of installations. The 6063-T6 alloy has adequate strength and good corrosion resistance. It is light weight, maintenance-free, and because of the non-magnetic properties of aluminum, keeps electrical losses to a minimum.

MP Husky manufactures Cable Tray in accordance with the latest edition of NEMA Standards Publication VE1 and CSA Standard C22.2 No. 126.1.

Materials & Construction

Steel

Steel cable trays are used principally in environments which are relatively free from corrosive attack. They are available with various types of corrosion-resistant finishes; usually hot-dip galvanized. The main advantages of using steel in cable tray fabrication are its high strength and low cost. Its disadvantages are increased structural weight, poor corrosion-resistance, and low electrical conductivity.

The idea that all steels are the same, except for chemical disposition is false. Carbon steels may be produced with chemical compositions (carbon, manganese, phosphorus, sulphur and silicon) within the specified limits of a given grade and still have characteristics that are widely dissimilar. Each grade and quality variation has a useful place, depending upon the end use and the methods of fabrication.

Basic components of steel cable trays are normally fabricated from either hot or cold rolled steel strips of commercial quality. Steels in this category are ASTM A-1011 CS Type B (formerly ASTM A-569) and ASTM A-1008 CS Type B (formerly A-366). Pre-galvanized steel conforms to ASTM A-653.

Stainless Steel

Today, hundreds of different alloy combinations exist for the endless variety of applications which utilize stainless and heat resisting steels. The primary elements added to obtain the various properties required in the steels include chromium, nickel, manganese, silicon, molybdenum, and the stabilizing elements of titanium columbium and tantalum.

Stainless steel contains at least 10 percent chromium, along with other elements to develop specific properties. Depending on the quality of the elements present in a stainless alloy, it will have a metallurgical structure which will be characteristic of the basic stainless steel groups. Metallurgists refer to these groups as the martensitic, ferritic, austenitic and precipitation hardening stainless steels. All standard austenitic alloys are given numbers in the "200" and "300" series, while the martensitic and ferritic alloys are numbered in the "400" series.

MP Husky offers cable trays and accessories in both the 304 and 316 series. These austenitic alloys are remarkable in several respects. Unlike the other two classes, they contain nickel in quantities from 4 to 22 percent, while the percentage of carbon is kept relatively low. When chromium is increased for improved corrosion resistance, nickel must also be increased to retain the austenitic structure.

304 stainless steel has chromium and nickel increased and carbon lowered to reduce carbide precipitation and increase corrosion resistance. Lowering the carbon content also makes welding easier.

316 stainless steel has molybdenum added to improve corrosion resistance and high temperature strength. The carbon content is also lowered to improve welding performance.

If your job calls for stainless steel, please contact the MP Husky factory for assistance in determining the correct type for your specific application.

Materials & Construction

Typical Applications include:

| Type 304 | Type 316 |
|----------------------------------|---|
| Beer Barrels | Chemical Processing Equip |
| Chemical Equipment | Chemical Storage and Transportation tanks |
| Coal Hopper Linings | Food Processing Equip |
| Cryogenic Vessels and Components | Steam Cooking Kettles |
| Dairy Equipment | Oil Refining Equipment |
| Evaporators | Paper Pulp Digesters and Evaporators |
| Food Handling Equipment | Petroleum Refining Equip |
| Milking Machines | Pharm. Processing Equipment |
| Nuclear Vessels and Comp | Scrubbers and Environmental |
| Oil Well Filter Screens | Soap and Photographic Handling Equipment |
| Pressure Vessels | General apps in Textile Ind. |
| Sanitary Fittings and Valves | |
| Shipping Drums | |
| Steel Tubes | |
| Textile Dyeing Equipment | |
| Hypodermic Needles | |
| Feedwater Tubing | |

Galvannealed

Galvannealed or Galvanneal, is the result from the combined process of galvanizing and annealing the steel. The galvanization is made through the hot-dipping (hot-dip galvanizing) process and gives a very fine grayish matte finish. Galvanneal does not flake off its galvanized coating when formed, stamped, and bent. The very fine matte finish acts like a primer and paint easily adheres to the tray. It is very rust proof, only white to dark grey marks appear if it comes in contact with water. Galvanneal sheets offers good paintability, weldability, corrosion resistance, and formability. It is extensively used in the automotive, signage, electric equipment, and other industries requiring good paintability and long reliable service life.

Husky Way is available in the galvanneal finish.

Fiberglass

MP Husky's Fiberglass Cable Tray systems are manufactured from glass fiber-reinforced plastic shapes and provides the load capacity of steel, plus the inherent characteristics afforded by our Pultrusion Technology: non-conductive, non-magnetic and corrosion-resistant. Although light in weight, the strength to weight ratio surpasses that of equivalent steel products. MP Husky's Fiberglass Cable Tray will not rust, nor does it ever require painting. It is available in both polyester and vinylester resin systems, manufactured to meet ASTM E-84, Class 1 Flame Rating and self-extinguishing requirements of ASTM D-635. MP Husky's Fiberglass Cable Tray comes in gray or blue (polyester resin) and beige (vinylester resin) but is available in custom colors upon request.

For more than 30 years, MP Husky's Fiberglass Cable Tray systems have been tested and proven in the harsh environment of the offshore oil and gas industry. Our tray has stood up to the test of being exposed to the corrosive conditions inherent in petroleum products, plus the daily punishment of exposure to wind, weather and salt water.

Husky Fiberglass Cable Tray is the perfect choice for harsh environments.

Corrosion Resistance

The underlying causes of corrosion are the same for all metals, all stemming from electrochemical phenomena. But the ways in which corrosion manifests itself are characteristic of each particular metal. Steel corrodes in the atmosphere with the formation of rust, which develops very rapidly on unprotected surfaces. In a clean atmosphere, aluminum slowly develops a white or silver grey patina.

Aluminum surfaces weather by a characteristic of pitting, and corrosion rates are often assessed by measuring the depth of the pits. The rate of pitting falls off after the first year or two, moving gradually to a standstill.

The strong, heat-treatable alloys of aluminum, with copper as one of the chief alloy elements, or certain fully heat-treated alloys with magnesium and silicon as major alloying elements, may manifest another type of attack, inter-crystalline in nature, which may cause more pronounced loss of strength if allowed to continue. Such materials may require protection by painting, cladding, or metal spraying, depending on the environment.

Several characteristic modes of corrosive attack may be distinguished as follows:

Simple Chemical Attack—the solution of a metal by an acid is an obvious example of simple chemical attack. Simple chemical attack occurs when sulfides are in contact with steel or copper. Ordinarily, aluminum is not subject to such attack. A classic example of such chemical attack is sludge retaining rainwater in the bottom of guttering. In this case, a corrosive solution is held in constant contact with the metal, and rapid attack may follow.

Electrochemical Corrosion—corrosion of a metal accelerated through contact with another metal in moist or wet conditions is known as bimetallic or electrolytic corrosion. This corrosion is due to the action of a simple voltaic cell. The presence of a conducting solution is essential to this phenomenon but the presence of dissimilar metals is not essential provided that a difference of potential exists.

In addition to the nature of the two metals, the extent of galvanic attack depends upon many other factors. Among these are:

- Nature of ions present in the electrolyte
- Polarization effects
- Effect of stable surface films on the metal
- Relative areas of anode and cathode
- The physical nature of the corrosion product
- Temperature variations

Each of these factors can influence the total resistance of the circuit. The following table is a compilation of solution potentials of metals and alloys with respect to a calomel electrode. It provides an initial guide to the possible effects of bi-metallic contact.

Corrosion Resistance

The composition of the base metals has no measurable effect on the life of zinc coatings. However, the composition of the base metals is the major factor in the years to perforation.

The corrosion rate of zinc varies more with the type of atmosphere (marine, industrial) than does that of steel or iron.

The chloride content of sea air apparently has an accelerating effect on the corrosion of zinc coating.

Rainfall removes about 75% of the corrosion products from zinc surfaces if the results of tests in rural, industrial and marine exposures are averaged together. The residual corrosion products remaining on the surface become basic in character and exert a retarding influence on corrosion. In highly industrialized or polluted atmospheres, this basic film may not exist, a fact which helps explain the more rapid attack experienced in such atmospheres.

Indoor atmospheres correspond in a general way to that prevailing outside in a given locality. Variations in humidity and temperature are somewhat less extreme and there is no rainfall indoors to dissolve and remove soluble corrosion products. In general, it may be assumed that the protective life of zinc coatings indoors is at least five times greater than that of coatings of the same thickness exposed to the outdoor atmosphere in the same locality.

The indoor corrosion of zinc may be severe when moisture condensation is frequent and air circulation is restricted. This effect is particularly bad in humid, tropical locations with nightly condensation.

These conclusions indicate zinc coatings will in any event have an acceptable service life expectancy regardless of how the end point of failure is defined. However, it should be noted that whenever maintenance, such as painting, is neglected, it is unreasonable to expect galvanized steel to last indefinitely.

Finishes

Metallic

Cable trays fabricated of steel can be protected from corrosion by coating with another metal using one of the following methods:

- **Continuous Hot-Rolled Galvanizing**

ASTM Designation A653 Specifications for Zinc Coated Galvanized Iron or Steel Sheets, Coils, and Cut Lengths—This process applies a zinc coating to sheet steel prior to fabrication of the product (pre-galvanized cable tray) by passing the metal downward through a molten ammonium chloride flux bath, and then into the zinc and out again by means of rolls.

The MP Husky standard zinc coating designation is G90, which has an average zinc coating weight of 1.25 ounces per square foot of steel for an average coating on both surfaces of 1.06 mils.

- **Hot Dipped Galvanizing After Fabrication**

ASTM Designation A123 Specification for Zinc Coating (Hot Dip) on Assembled Steel Products—This process is used to apply a zinc coating to an already fabricated product. The product is first cleaned in a caustic bath, then further cleaned by a pickling acid bath. The article is then thoroughly rinsed and dipped in a bath of molten zinc. The nature and thickness of the coating depend largely on the immersion rate, temperature of the bath, immersion period, and withdrawal rate. The resulting coating consists of an outer layer of relatively pure zinc, and lower layers of iron-zinc compounds.

Generally, hot dip coatings are highly non-uniform, except on very simple shapes and are usually thickest at small recesses (unless these remain uncoated altogether). The advantage of this method is that the zinc applied is thicker than when applied by other processes. However, the protective characteristics of zinc coating under atmospheric conditions have been found to be equal, regardless of process: i.e. zinc coatings of the same weight have approximately the same service life.

- **Galvannealed**

Galvannealed or Galvaneal, is the result from the combined process of galvanizing and annealing the steel. The galvanization is made through the hot-dipping (hot-dip galvanizing) process and gives a very fine grayish matte finish. Galvaneal does not flake off its galvanized coating when formed, stamped, and bent.

Corrosion Resistance

The corrosive nature of sea water and of coastal environments is partly due to the low electrical resistance of salt solution. Similarly, the bad effects of industrial atmospheres on metals arise largely from the sulphur compounds, sulphurous and sulfuric acids, which are largely formed as a result of burning coal, and which dissolve in the moisture in the air or in the rain as it falls, or in films of condensed water on the metal.

To summarize, the extent and type of moisture is an important factor in determining the severity of galvanic attack. For indoor service, where wetting is infrequent, galvanic corrosion normally is no problem. Outdoors, attack may be relatively rapid in sea coast and industrial environments, where contamination, hence conductivity, of rain and condensed moisture is high. Several general rules can be applied in selecting metal combinations for use in corrosive environments. These are:

Select metals as close together in the galvanic series as possible. For the anodic protection of steel, metals above steel in the series should be selected, or the steel should be galvanized or otherwise protective-coated. Avoid combinations having a smaller area of the more anodic metal than of the cathodic, to avoid excessive current density on the anodic areas. Insulate dissimilar metals wherever possible to minimize galvanic corrosion.

Aluminum Alloys

The corrosion-resistance of aluminum alloys is due to the presence on the surface of a very thin protective film of aluminum oxide which has strong self-healing properties when damaged. The oxide film begins to form immediately on the surface of the bare metal exposed to air and grows rapidly for several days, then slowly for a month, when it reaches a thickness of approximately 0.0000002". Corrosion of aluminum can only occur when the oxide film is damaged or removed and conditions prevent its formation.

Substances which may come in contact with aluminum can be divided into three groups:

Those substances which attack the oxide film. These are most strong alkalis, mercurical compounds, and most strong acids.

Substances which cause localized breakdown of the oxide film (pitting) - and for which aluminum is suitable only under certain conditions, such as some natural fresh waters and aqueous solutions containing traces of mercury, copper, or other heavy metals.

Substances which do not attack the oxide film. The majority of substances fall in this group, including many industrial chemicals.

The majority of aluminum installations give perfectly satisfactory service, free from corrosion, and only in exceptional cases do problems occur. When problems do occur, they can be attributed to one or more of the following causes:

- Wrong choice of alloy
- Exposure conditions
- A bimetallic joint which causes galvanic corrosion
- Crevices
- Unwise location of the aluminum assembly, resulting in deposition corrosion
- Contact with aggressive chemicals

Among the heat-treatable alloys, the 6000 series has good resistance to industrial and marine atmospheres.

With the exception of certain corrosive chemicals, no corrosion at all will occur if water is not present. Thus, indoor installations that are not in actual contact with water or installations which are maintained in dry conditions, will not corrode.

Steel with Zinc Coatings

The data from which comparative performance of different types of zinc coating can be inferred, are generally obtained from comprehensive exposure tests in various atmospheres, such as those conducted since 1926 by the American Society of Testing Materials. From the results of these tests, the following conclusions can be made:

The corrosion rate of zinc on galvanized sheets is practically linear in industrial or rural atmospheres, and in a marine atmosphere that is polluted with industrial contaminants. Thus, in these atmospheres, a sheet with double the weight of coating than that of another sheet can be expected to last twice as long before rusting of the base metal occurs.

Loading

This section presents guidelines for classification of design conditions with respect to weather factors, methods of determination and application of various types of loadings encountered, maximum allowable working stresses and other pertinent considerations. This information will assist the designer in evaluating materials and product catalog information so that he can design a system which will achieve the desired strength and rigidity at the lowest possible installed cost.

Load Classification

Loads on structures are usually divided into three types:

- **Dead loads** that do not change their magnitude or their position during the life of the structure.
- **Live loads** that change their magnitude, their position and/or their direction during the life of the structure.
- **Dynamic loads** that are caused by the motion of the live load, or the movement of the structure.

Because of their general nature, these load classifications can be used for any structure. However, for the purpose of establishing a practical load classification for cable tray system design, it is necessary to create additional subdivisions and provide a guide for assumption of specific loads.

Thus, for cable tray system design, the three basic load types are also considered as follows:

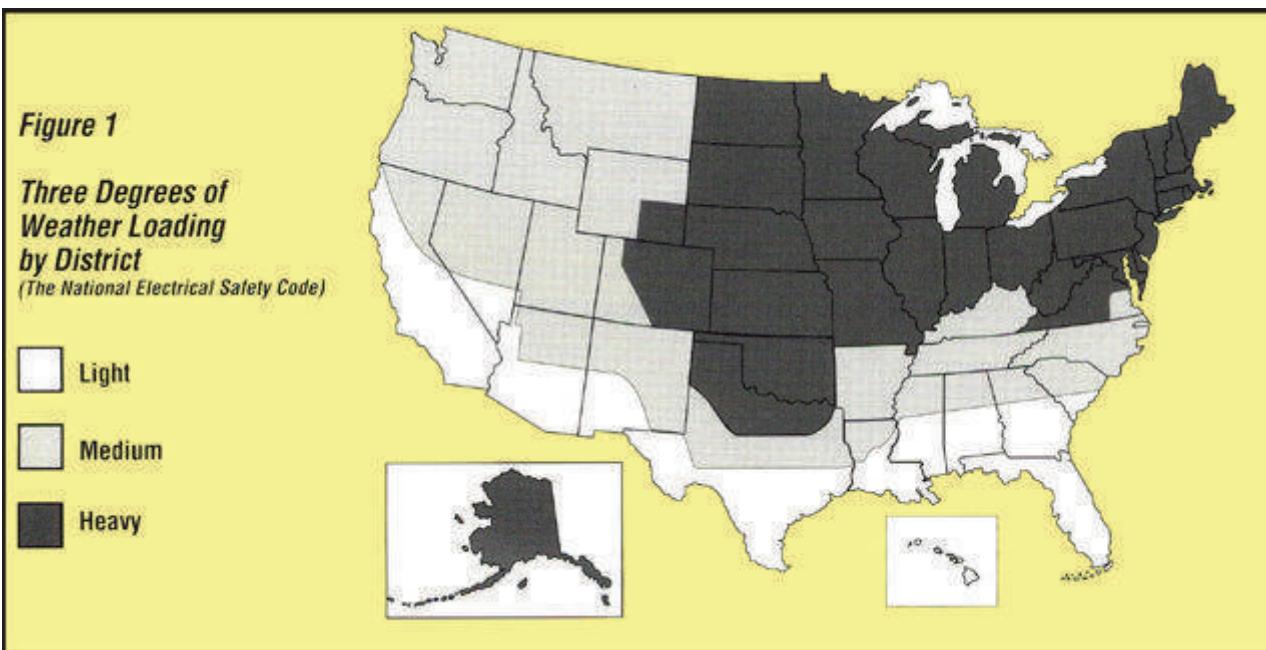

Dead Loads

Since dead loads are the weight of the members that make up a tray or tray support, they have a known value. A summation of the weights of the individual members is all that is required to calculate the dead load.

Live Loads

In cable tray design, dynamic loads are considered to be as follows:

- The design load is the weight of cables, cable tray accessories, and sometimes workers (which vary in both magnitude and position). Cable only design loads can be determined by adding the component weights of the system. Any provision for workers will require an assumption of magnitude and position—for practical purposes, an assigned weight acting at mid span of the tray.
- Parasitic loads such as ice, snow, wind, traction, and electromagnetic forces exist only because the tray exist. They are the most difficult to determine, and different assumptions can be made about their effect on the overall loadings. The following information will provide a general guide.

Loading

Three general degrees of loading due to weather conditions are recognized in the National Electrical Safety Code, and are designated as heavy, medium and light loading.

Districts in the United States in which these loadings are normally applicable are indicated in Figure 1. Values used in determining conductor loadings under these conditions for ice, wind and temperature are given in the Table 1—Degrees of Loading Due to Weather. However, modifications of these values are necessary when applied to cable tray systems, since the NES is concerned primarily with the construction of overhead supply and communication lines. These modifications are:

Ice Loading

The NES loading of 1/2" thickness is applied to both cables and cable tray. In applying loadings to interlocked armored cables, and bare stranded conductors or suspension cables, the coating of ice is considered as a hollow cylinder with an inside diameter equal to the outside diameter of the cable or strand. Ice is assumed to weigh 57 lbs. per cubic foot.

Snow Loading

The NES does not consider snow loading, and in general this also applies to cable tray systems. However, in the case of a solid cover on a tray, the minimum load of 5lbs. per square foot should be used for outdoor installations where snow is a factor.

Wind Loading

The NES loadings are modified as follows, in order to provide adequate protection against the maximum wind velocities encountered with consideration of the shapes of the various structures (not considered by NES).

Wind velocity—in the loading tables, wind means horizontal wind. Wind velocity should be considered to be true wind speed, corrected for instrumentation errors. Any variation of velocity with height is not considered. All structures will be under 100 feet in height, and 100% of the ground velocity is assumed to be adequate.

Wind loads—the exteriors of all structures, with the exception of cylindrical structures, should be loaded with a wind pressure normal to the surface, having an intensity given by the formula:

$$W_p = C V_p$$

W_p = wind pressure in pounds per square foot

C = coefficient depending upon the size, shape, and position of the structure in the wind and having values specified in Table 2, Shape Factors

V_p = impact pressure = $0.00256V^2$ where V = the design velocity. Values of V_p may be obtained from Table 3, Impact Pressures

Wind direction and distribution—the allowance for wind pressure shall be made assuming the wind from any possible direction to be critical. Wind loads shall be considered uniformly distributed. Average annual tornado frequency, average wind velocities for different areas of the U.S. are shown in Figs. 2 and 3.

Traction Forces

Traction forces are caused by the cables starting and stopping during the cable installation period and they vary in magnitude and direction. They are of such nature, therefore, that no general assumptions can be made to provide for them. However, the safety factors selected for the basic design stresses should be conservative enough to provide for these forces when they do occur.

Table 1

| Degrees of Loading Due to Weather National Electrical Safety Code Values | | | |
|---|------------------|--------|-------|
| | Loading District | | |
| Condition | Heavy | Medium | Light |
| Radial thickness of ice (ins.) | 0.50 | 0.25 | 0.00 |
| Horizontal wind pressure (lbs./sq.ft.) | 4 | 4 | 9 |
| Temperature (degrees F) | 0 | 15 | 30 |

Table 2

| Shape Factors | |
|----------------------------|------------------|
| Structure | Shape Factor "C" |
| Isolated Structural Shapes | 2.0 |
| Trusses, Towers, Etc. | 2.0 |
| Wires, Cables, Etc. | 1.2 |
| Pipe Supports, Poles, Etc. | 1.0 |

For trusses and towers the wind load is assumed to be acting on the projected area of the windward face only. For structures with circular cross sections, the affected area is the area projected on a vertical plane.

Loading

Electromagnetic Forces

These forces, caused by short-circuit current during a cable fault, vary in magnitude and position. It is impractical to make an assumption providing for them. Ordinarily, the safety factors selected for the basic design stresses will be adequate. However, in installations where these forces are of such magnitude that they become a factor in the design of the cable tray system, adequate provision must be made so that the design stresses are not exceeded.

(The Average Annual Number of Days with Thunderstorms for various areas of the United States are shown in Figure 4).

Dynamic Loads

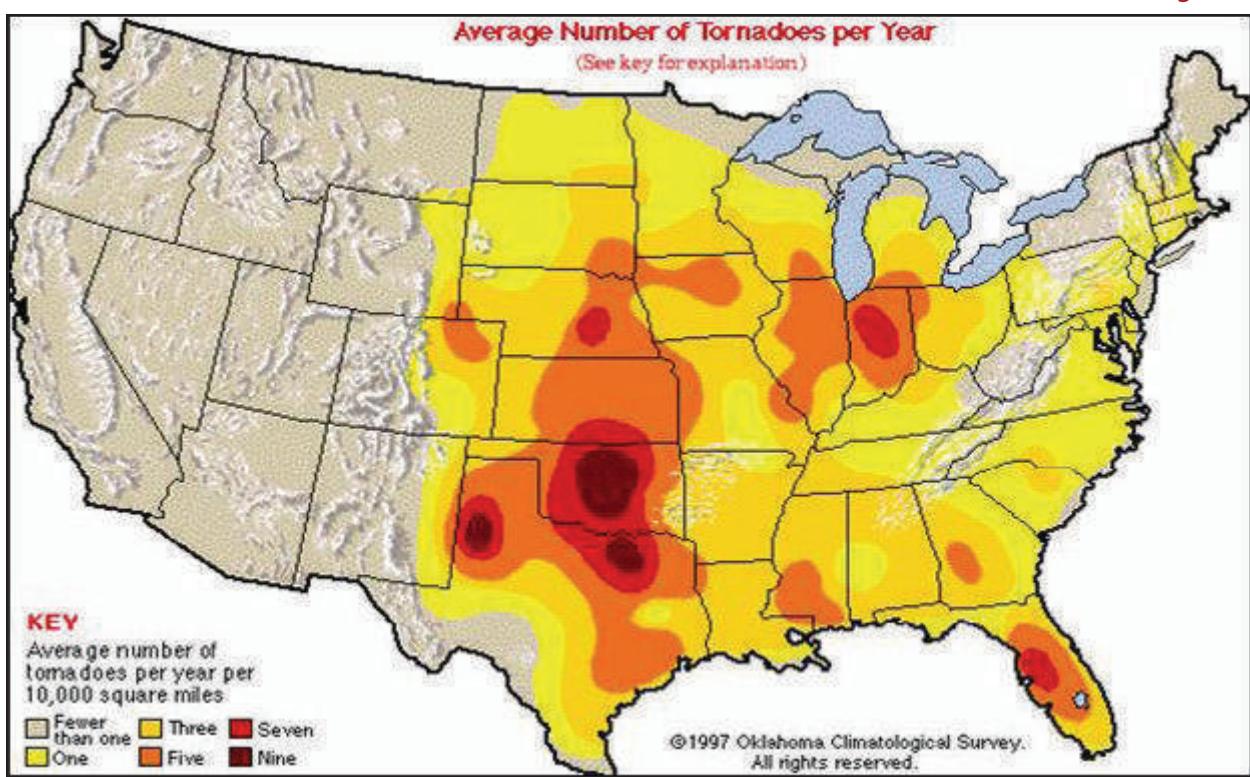

Impact loads which result because the live load is in motion, are loads in addition to the static weight of the live load. Such loads could be caused by cables being dropped onto it, or by workmen walking on it or climbing up or down a ladder leaning against it. These loads are provided for in the same manner as traction forces—the safety factors selected for the basic design stresses should be conservative enough to provide for these forces if they occur.

Table 3

| V (mph) | Vp (psf) | V (mph) | Vp (psf) |
|---------|----------|---------|----------|
| 15 | 0.58 | 85 | 18.5 |
| 20 | 1.02 | 90 | 20.7 |
| 25 | 1.60 | 95 | 23.1 |
| 30 | 2.30 | 100 | 25.6 |
| 35 | 3.13 | 105 | 28.2 |
| 40 | 4.09 | 110 | 30.9 |
| 45 | 5.18 | 115 | 33.8 |
| 50 | 6.39 | 120 | 36.8 |
| 55 | 7.73 | 125 | 40.0 |
| 60 | 9.21 | 130 | 43.3 |
| 65 | 10.80 | 135 | 46.6 |
| 70 | 12.50 | 140 | 50.1 |
| 75 | 14.40 | 145 | 53.8 |
| 80 | 16.40 | 150 | 57.6 |

These values are for an air density of 0.07651 lbs. per cu. ft. corresponding to a temperature of 60°F and barometric pressure of 14.7 lbs. per sq. in.

Figure 2

Loading

Inertia loads

Inertia loads are caused when the structure itself is in motion, such as may occur during an earthquake. It is usually considered that an earthquake gives the structure a horizontal acceleration, and the resulting acceleration and deceleration cause forces proportional to the mass and to the acceleration and deceleration. These loads represent special design requirements, and the design loading should be in accordance with the ASA's "American Standard Building Code Requirements for Minimum Design Loads in Buildings and Other Structures" or other suitable specifications. Seismic probability for various areas in the United States is given in Fig. 5.

Design Loadings

Basic cable trays are designed on the basis of maximum allowable stress for a certain section and material. Therefore, the allowable cable load will vary with span, type and width of tray. The design loadings for cable tray are given in the form of load tables. These tables appear in another section of the catalog.

The design loadings are to be used for designing standard supports, which necessitates assuming design loadings for the cable trays to be supported. If the design loadings of the cable trays exceed those listed, or if the assumptions for the loading of the open area or frame type supports exceed the conditions herein, standard supports cannot be used. Special supports must be designed on the basis of data for actual conditions.

Application of Loads

The application of all loads shall be to "conventional" or "simple" framing (unrestrained, free-ended), which assumes that the ends of the members are connected for shear only and are free to rotate under load.

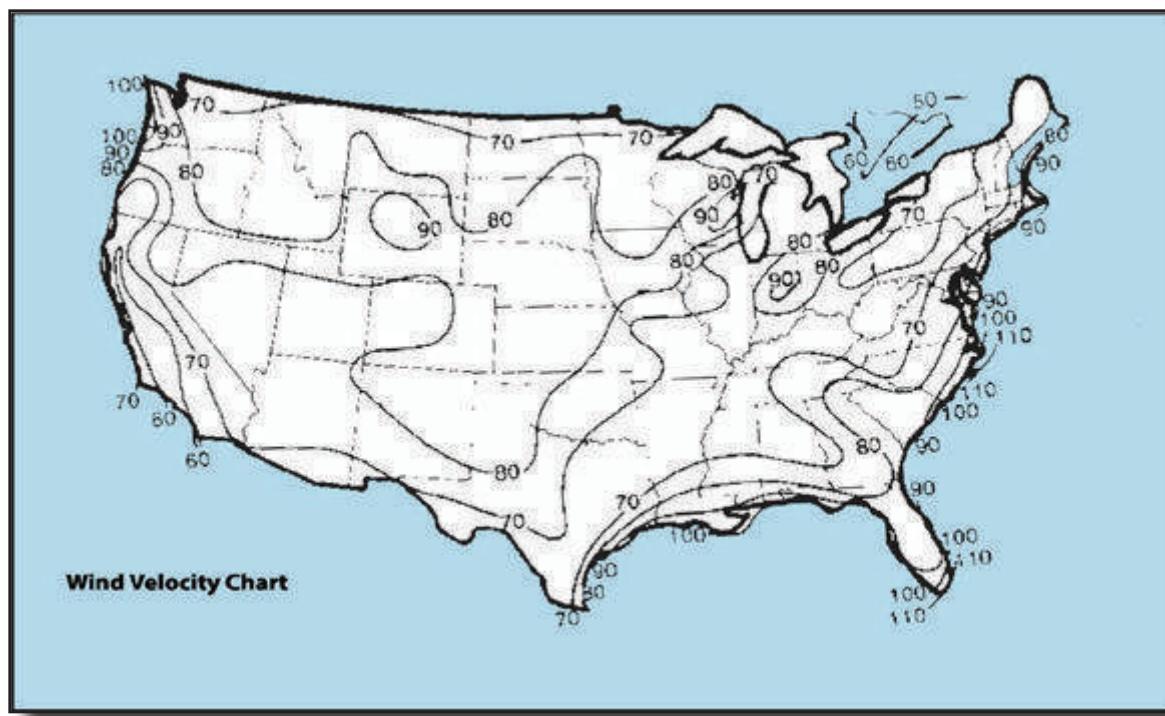

When calculating lateral strength, the lateral and vertical design loads shall be taken as acting simultaneously. It is assumed that maximum ice loads and maximum wind loads do not occur simultaneously.

When calculating longitudinal strength, the longitudinal design loads shall be taken without consideration of the vertical and lateral design.

When latticed structures are concerned, the actual exposed area of one lateral face shall be used in computing lateral and longitudinal loading.

Where a change of direction or suspension cables occurs, the loading upon the structure, including workmen, shall be assumed to be a resultant load equal to the vector sum of the lateral wind load and the resultant load imposed by the suspension cables due to their change in direction. In order to obtain these loadings, a wind direction shall be assumed which will give the maximum resultant load.

Figure 3

Loading

It is recognized that deformation, deflection, or displacement of parts of the structure, will in some cases change the effects of the loads assumed. In the calculations of stresses, however, no allowance shall be made for such deformation, deflection, or displacement of supporting structures.

Members subject to stresses produced by a combination of wind and other loads may be proportioned for unit stresses 33.3% greater than those specified for dead and live load stresses provided the section thus required is not less than that required for the combination of dead load, live load, and impact (if any). A corresponding increase may be applied to the allowable unit stresses in their connecting rivets, bolts, or welds.

Members subject to stresses produced by the assumed Class 1 tray lateral loading may be proportioned as specified for wind loads.

Determination of Design Loadings

The following procedures and values for design loadings have been established by MP Husky. The data is based on test results under various installation conditions, and the experience of practical application in the design of components and systems.

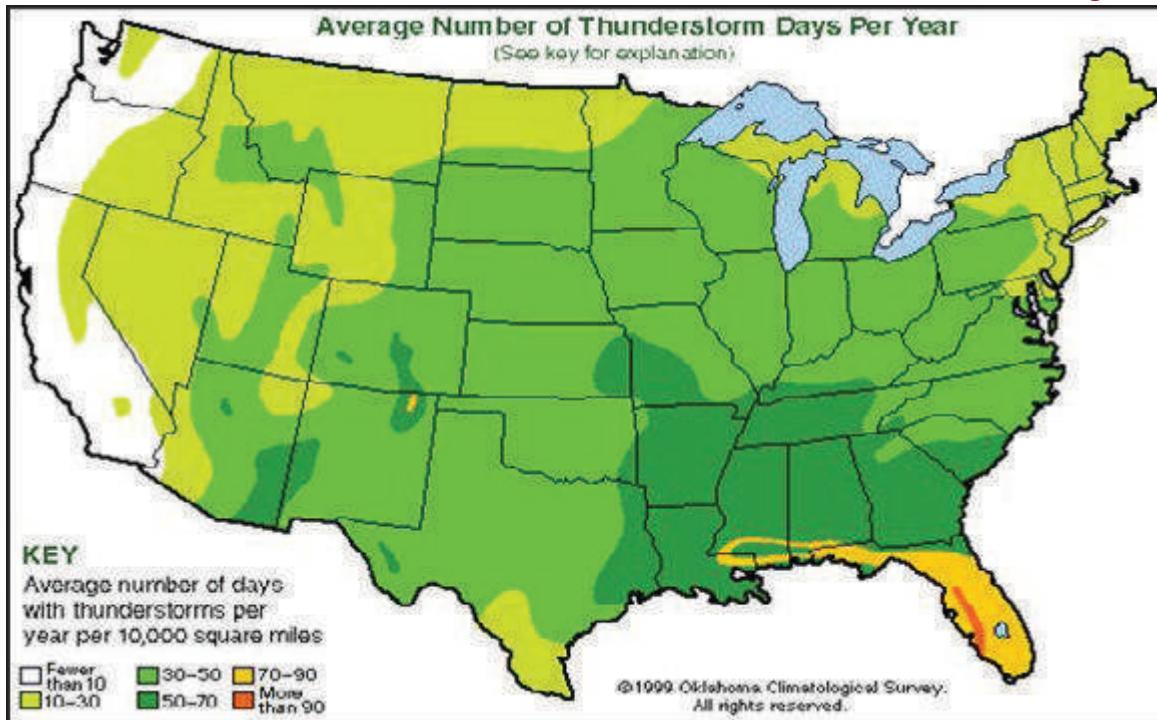

In each instance, the loadings are given for three classes of design conditions as shown in Table 4, Design Conditions.

These classifications have been established from modifications of the National Electrical Safety Code's "Degrees of Loading Due to Weather Conditions".

Table 4

| Design Conditions | | | |
|---------------------|-------------------|--------------------|--------------------|
| Location | Class 1 Indoor | Class 2 Outdoor | Class 3 Outdoor |
| Wind Velocity (mph) | 0 | 25.0 | 100.0 |
| Wind Pressure (psf) | 0 | 1.6 | 25.6 |
| Ice (in) | 0 | 0.5 | 0.5 |

Figure 4

Loading

Cable Tray Loading (tray in horizontal position)

Vertical Design Loading

CLASS 1

The loading shall be a uniformly distributed load of 40 lbs. per foot, equivalent to the vertical load per foot of the cables, tray and accessories.

CLASS 2

The loading shall be a uniformly distributed load of 52 lbs. per foot, equivalent to the vertical load per foot of ice-covered cables and tray. The weight of ice computed on the basis of 1/2 inch thickness and 57 lbs. per cubic foot density.

CLASS 3

Same as for Class 2. Values established for the above (lbs. per linear foot)

Class 1: 40 Class 2: 52 Class 3: 52

Lateral Design Loading

CLASS 1

The loading shall be a uniformly distributed load of 120 divided by span length (in feet) lbs. per foot, equivalent to a 50lb ladder leaning against the tray at an angle of 75° with horizontal plane and 200 lbs man at mid span. (A position of the man on the ladder shall be assumed which will give the maximum resultant loading on the tray.

CLASS 2

The loading shall be lateral, horizontal wind pressure of 1.6 lbs. per square foot upon the projected area of a 4 inch deep ice-covered tray multiplied by a shape factor of 2.0, or the design loading for Class 1 if it is greater.

CLASS 3

The loading shall be a lateral, horizontal wind pressure of 25.6 lbs. per square foot upon the projected area of a 4 inch deep tray without ice-coating multiplied by a shape factor of 2.0. Values established for the above (in pounds per linear foot)

120

Class 1: sp Class 2: 1.33 Class 3: 17

Longitudinal Design Loading

CLASS 1

Same as Class 3.

CLASS 2

Same as Class 3.

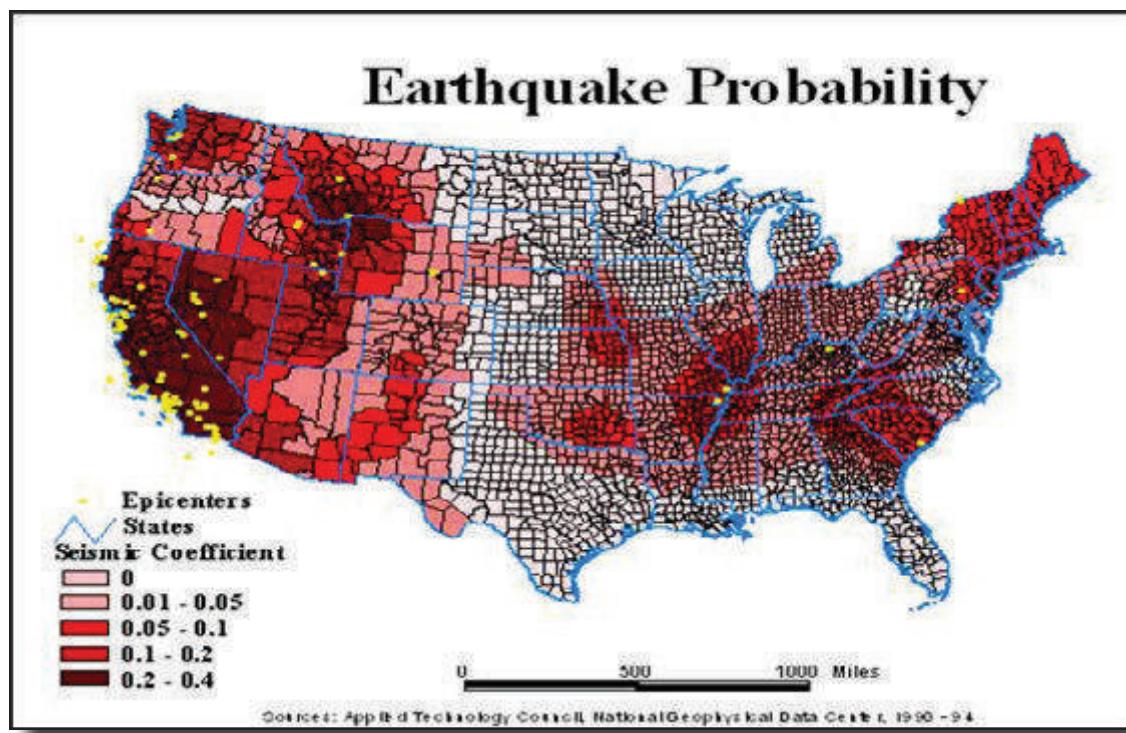

CLASS 3

The loading shall be a lateral, horizontal wind acting against the tray at an angle of 45° to the longitudinal axis and on the projected area of a 4 in. deep tray (without ice-coating) with a pressure of 25.6 lbs. per square foot multiplied by the shape factor of 2.0. Longitudinal design Loading as above will insure adequate provision for traction forces when they occur.

Values established for the above (lbs. per linear foot)

Class 1: 12 Class 2: 12 Class 3: 12

Figure 5

Loading

The concept of "**Cables in Free Air**" for power distribution and control cables has been adopted primarily for economic reasons. Cable tray support systems should be designed, whenever possible, for minimum installed cost. In order to achieve this objective, the engineer must bear in mind that the general design rules established for aluminum and steel structures are not always compatible with design rules for a cable tray system. This is particularly applicable in the case of restrictions on deflection.

Since the most economical cable tray system uses heat treated aluminum alloys, or high strength steels with long spans, any limitation on deflection which will not permit the best utilization of material and design will increase the cost. By limiting the maximum fiber and shear stress used in the design the adequacy and safety of the structure is assured.

Why Limit Deflection?

The primary reason to limit deflection in cable tray systems is appearance. Engineers and owners take pride in the appearance of their installations. So rigid restrictions on deflection of cable trays installed at eye level or in a prominent location are common. However, it is neither economical nor good engineering practice to restrict deflection of a cable tray system in less prominent areas.

Methods of Decreasing Deflection

There are various ways to limit deflection of a cable tray. If the objective is minimal installed cost, they should be considered in this order:

- **Decreasing stress by decreasing the bending moment.** This can be accomplished by introducing restraining moments at the end of a span in the form of a rigid support. The deflection in a continuous beam, with negative bending moments at the intermediate support points, is only a fraction of the deflection in a simple beam.
- **Increasing depth of the tray.** Deflection in any location can be reduced by increasing the depth of the load-carrying side members and/or by adding to their cross-sectional area. Adding to the depth generally utilizes the material most economically.
- **Increasing modulus of elasticity.** Since the modulus of elasticity of steel is 29×10^6 psi, and that of aluminum alloys is only 10×10^6 psi, greater deformation of aluminum alloy trays is to be expected at any given stress level. Under its own weight, an aluminum beam will deflect the same amount as an identical steel beam, since not only the weight, but also the modulus of elasticity is only one-third that of steel. However, under the same applied load (disregarding the beam's own weight), aluminum will deflect almost three times as much as steel.

- Therefore, consideration must be given to the choice of material for any one location, for an isolated run or for an entire installation.
- **Decreasing span length.** For economic reasons, this method of reducing deflection should be a last resort, since it increases field labor considerably. However, it can be an effective means to improve the appearance of an installation when the number of spans to be reduced is small in comparison to the number in the entire installation.

Deflection Criteria Applied to Cable Tray

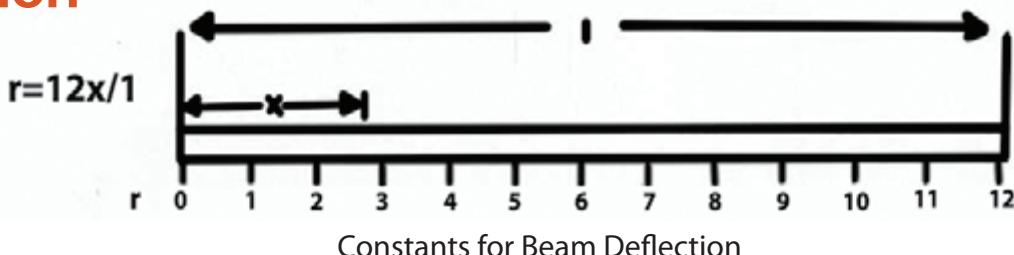

Design rules and specifications developed for steel should not be applied to aluminum alloys since this would not permit the most economical use of these materials. Deflection criteria which apply only to steel, and should not be used when the most economical system is desired include:

- **Span-deflection ratio** - Example: Deflection is limited to 1/300 of the span by the National Electrical Manufacturers Association specifications for structures supporting air switches. While very important in that instance, as even slight deflection could cause misalignment in the operating mechanism and result in binding and difficult switch operation, the application of this specification to a cable tray is uneconomical and not recommended.
- **Depth to span ratio** - Example: The American Institute of Steel Construction, in the specifications for buildings, specifies the depths of beams and girders in floors to be not less than 1/24 of the span, or not less than 1/20 of the span where shock or vibration may be encountered. This specification ensures a certain rigidity and levelness of the structure which is important in that instance, but cannot be justified for cable tray systems because of the higher cost involved.
- **Deflection constant** - Example: Deflection is limited to a certain amount by an engineering company for a tray system. While such specifications might make a system using 8-foot spans look better, it prohibits the use of more economical designs with longer spans which have a much greater deflection and still look acceptable. Such a specification increases the cost of the tray system unnecessarily, especially if the trays are to be installed well above eye level.

Summary

As a guide, a span-deflection ratio of around 1/200 satisfies most owners. This ratio provides an allowable deflection of 0.6" in a 10-foot span, 0.72" in a 12-foot span, and 1.20" in a 20-foot span under the actual loads encountered. Data for calculating deflection is presented in Table 5, *Constants for Beam Deflections*.

Deflection

Table 5

| r | Free Beam | 2 Span | | 3 Span | | 4 Span | | 5 Span | | | Fixed Beam | r |
|----|-----------|--------|--------|--------|--------|--------|--------|--------|--------|--------|------------|----|

*Maximum Deflection for Continuous Beams up to and including 5 spans.

$$\Delta = C \frac{W_c l^4}{EI} \quad \text{where}$$

Δ = Deflection (inches)
 W_c = Carrier Load (lbs/ft)
 l = Span Length
 E = Modulus of Elasticity (psi)
 I = Moment of Intertia of Carrier Stringer (in⁴)
 C = Values shown in table

Example: A cable tray with specified load has a simple beam deflection of 1.92 inches at mid-span. Find the deflection for the fifth span of the 5-span installation. From the table above, the maximum constant in the free beam columns is 11.31. Note that this is the center of the span. For the 5-span installation, the maximum constant in the 5-span column is 5.65, which is not in the center, but 7/12 of the span length from the support between spans 4 and 5. The maximum deflection of this fifth span is given by:

$$\Delta = 1.92 \times \frac{5.65}{11.31} = 0.96 \text{ inches}$$

Electrical Equipment & Grounding

A cable tray system must provide protection to life and property against faults caused by electrical disturbances, lightning, failures which are a part of the system, and the failure of equipment that is connected to the system. For this reason, all metal enclosures of the system, as well as non-current carrying or neutral conductors, should be tied together and reduced to a common earth potential.

This includes the structural steel of a building, all piping for water, gas, steam, and sewers, tanks, well casings, down spouts, gutters, siding and roofing. There are two distinct divisions to the grounding problem:
System grounding and Equipment grounding.

Electrical Design & Grounding

The following explanation gives the reasons for grounding, and how to provide for it.

System Grounding

The purpose of system grounding is to drain off any excessively high voltages that may accidentally come on the tray system. If the system is properly grounded by means of a low-resistance conductor of sufficient capacity, the current will be carried off to earth immediately with a minimum danger of fire or shock. In a grounded system, an accidental grounding of one of the current carrying conductors will result in a short circuit, and cause a fuse or circuit breaker to open.

Equipment Grounding

Equipment grounding means the connection to earth of all exposed, non-current carrying metallic parts of the components of the distribution system. The purpose of this ground is to prevent a voltage higher than earth potential on cable tray or equipment. Grounding thus reduces the danger of shock or fire in the event a live conductor comes in contact with these conductive parts.

Methods of Grounding

Effective grounding must be permanent and continuous, and have ample capacity to safely conduct any current likely to be imposed on it. It should also have impedance sufficiently low to limit the potential above ground and to facilitate operation of over-current devices in the circuit. A continuous, underground metallic water supply system is acknowledged to be the best electrical ground. Other suitable methods of grounding include continuous metallic steam and gas piping systems, the grounded metal framing of the building,

or an artificial electrode such as a driven steel pipe, galvanized or otherwise protected from corrosion, or a buried metallic plate.

The tray system and equipment ground connections should be made to the same electrode at the service entrance, on the supply side of the equipment used for disconnecting the service. Equipment should be solidly tied in with the system ground. It is also important, that wherever multiple grounds are used, they be tied together in order to avoid any difference of potential between the various parts of the tray system.

Complete rules for grounding are contained in Article 250 of the National Electric Code.

Electrical Properties of Cable Tray

MP Husky has always recognized the importance of electrical design, as well as structural design, to provide positive, safe protection to personnel, facility and equipment. Thorough testing has proven that the cable support system must be electrically designed for maximum carrying capacity, in that: power cables may have short circuit capacity from 5000 to 150,000 amperes, and the division of fault current places considerable burden on the support system, even though adequate grounding has been provided. Table 6 shows the division of fault current determined by tests of an aluminum and a steel interlocked armored 3-conductor 4/0 cable on a MP Husky aluminum cable ladder.

It is not the purpose or intent that the support system be used for a continuous ground, but to provide extremely high one second current carrying capacity as a safety feature. The entire system should be grounded at periodic intervals to keep the potential at or below 100 volts in case of a cable fault. MP Husky cable trays are classified by Underwriters Laboratories® as to their suitability as an equipment grounding conductor only.

Division of Fault Currents

Table 6

| | Steel | Armored | Cable | Aluminum | Armored | Cable |
|--|-----------------|-----------------------|------------------|-----------------|-----------------------|------------------|
| Fault Current Path | % through armor | % through ground wire | % through ladder | % through armor | % through ground wire | % through ladder |
| Armor and Ladder | 50 | -- | 50 | 23 | -- | 77 |

Note:

For electrical properties of pre-galvanized cable trays, refer to the electrical properties given above for hot dipped galvanized cable trays of the same style.

Example: For electrical properties of PHA cable tray, refer to SHA in the above table.

Sizing

Sizing Trays for Multiple-Conductor Cables

Section 392.2 lists the requirements for installing multiple-conductor cables in ladder, ventilated trough, solid-bottom, or ventilated channel type trays.

For ladder or ventilated trough trays, the diameter of all cables No. 4/0 and larger must be added together and the total must not exceed the width of the cable tray. Cables must be placed side by side. Table 392.9, Column 1 is used for cables less than 4/0. These cables do not have to be placed side by side. Table 392.9, Column 2 is used for a combination of cables rated larger than 4/0 and smaller than 4/0.

The total cross-sectional areas of the cables in trays with an inside depth of 6" or less, containing control and/or signal cables must not exceed 50% of the cross-sectional area of the tray.

For solid bottom trays, the diameter of all cables No. 4/0 and larger must not exceed 90% of the cable tray width. Table 392.9, Column 3 is used for cables smaller than 4/0. Table 392.9, Column 4 is used for a combination of cables rated 4/0 or larger, or less than 4/0.

For trays with an inside depth of 6 inches or less, containing control and/or signal cables, the total cross-sectional areas of the cables must not exceed 40% of the cross-sectional area of the tray.

For ventilated channel type trays, the total cross-sectional areas of all cables must not exceed 2.5 square inches for 3 inch wide trays or 3.8 square inches for 6 inch wide trays.

Sizing Trays for Single Conductor Cables

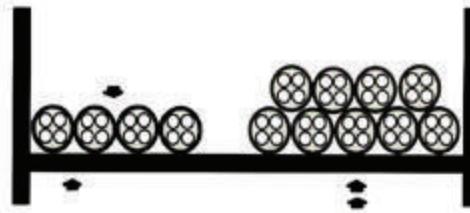

For ladder or ventilated trough trays, the total diameter of all cables 1000MCM and larger must not exceed the width of the cable tray. Table 392.10, Column 1 is used for cables smaller than 1000MCM. Tables 392.10, Column 2 is used for a combination of cables rated 1000MCM and larger, and smaller than 1000MCM.

For ventilated channel type trays, the total diameter of all cables must not exceed the inside width of 4" or 6" wide trays.

Problem:

What size ladder-type cable tray is required for nine multi-conductor smaller than 4/0 and four multi-conductors larger than 4/0? The total diameter (in inches) for the 4/0 and larger cables is 12.6" and the total area for cables rated less than 4/0 is 22 sq. in.

Cable tray width must be selected from Table 392.9 and be based on the calculation in Column 2.

Note: Square inch area of cables obtained from manufacturer.

Step 1: 392.9 (a) (3)

Sq. in. of cables smaller than 4/0 = 22 sq. in.

Diameter of cables larger than 4/0 = 12.6 in.

Step 2: Table 392.9

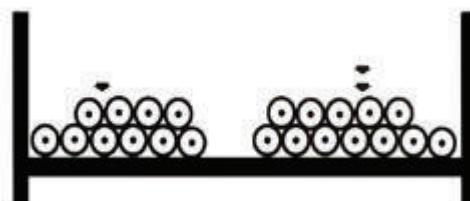

22 sq. in. + (12.6 x 1.2) = 37.12 sq in.

A 36" tray has 42 sq. in. area

Answer: The inside width of the cable tray must be equal to 36".

Problem:

What size tray is required for ten No. 250 MCM RHH RHW copper conductors and twelve No. 750 MCM RHH RHW copper conductors laid in a ladder-type tray?

Cable tray must be selected from Table 392.10, Column 1 based on square inch area.

Step 1: 250 MCM = .554 sq. in.

750 MCM = 1.286 sq. in.

Step 2: Table 392.10 (a) (2) Table 392.10, Column 1

.554 x 10 = 5.54 sq. in. + 1.286 x 12 = 15.43 sq. in. = 20.97 sq. in.

Step 3: Table 392.10, Column 1

18" wide tray = 19.5 sq. in.

24" wide tray = 26.0 sq. in.

Answer: The inside width of the cable tray must be equal to 24".

Formulas & Conversions

Convert a Concentrated Load to Pounds per Linear Foot:

$$\text{Formula: } W_e = \frac{2 \times (\text{Concentrated Load})}{\text{Span (Ft)}}$$

Where

Concentrated Load = 200 pounds

Span = 20 feet

W_e = Converted Load in pounds per linear foot

$$\text{Calc: } \frac{2 \times 200}{20} = 20 \text{ lbs/ft}$$

Formula: Concentrated Load times 2 divided by the support span.

Example: A 200 pound concentrated load on a 20 foot span would be a load of 20 additional pounds per linear foot. This load can be added to the uniform cable load for a total load and compared to a load shown in a load deflection table.

Convert a Load with a 1.5 Safety Factor to a Load with a 2.0 Safety Factor:

$$\text{Formula: } W_k \times \text{Multiplier}$$

Where

W_k = 100 pounds per foot

Safety Factor = 1.5

Multiplier 0.75 for 2.0 safety factor, 0.60 for 2.5 S.F.

$$\text{Calc: } 100 \times 0.75 = 75 \text{ lbs/ft}$$

Formula: Multiply the load shown with a 1.5 safety factor by 0.75 to convert the load to a 2.0 safety factor.

Example: A load of 100 pounds per foot with a 1.5 safety factor would be 75 pounds per foot with a 2.0 safety factor. The multiplier for a 2.5 safety factor would be 0.60.

Obtain a Deflection for a Load that is smaller than a Load Shown in a Load Deflection Table:

$$\text{Formula: } D_2 = \frac{W_2}{W_1} \times D_1$$

Where

D_2 = Calculated Deflection with smaller load
 W_2 = 150 lbs/ft Smaller Desired Load
 W_1 = 200 lbs/ft load in load table
 D_1 = 1.5" Deflection for 200 lb load in table
 S = 12 Foot Span in Deflection Table

Calc: $\frac{150}{200} = 0.75 \times 1.5'' = 1.125''$

Formula: Divide the desired load by the load shown in the load deflection table and multiply the answer times the deflection shown for the known load in the load deflection table.

Example: If the load table shows 200 pounds per foot on a 12 foot span with 1.5 inches of deflection and you want to know the deflection for a 150 pounds per foot on the 12 foot span you would divide the load desired (150) by the load known (200) and multiply the answer (0.75) times the known deflection (1.5"). The answer would be 1.125" deflection at 150 pounds per foot on a 12 foot span.

Formulas & Conversions

Calculate a Load for a Shorter Span that is not shown in a Load Deflection Table:

Where

$$\text{Formula: } W_2 = W_1 \times L_1^2 / L_2^2$$

- W_2 = Calculated load for the 10' span
- W_1 = Tested 100 lb/ft load or load in load table
- L_1 = Tested 12' span or span in load table
- L_2 = Shorter 10 ft span not tested or in load table

$$100 \times 12^2$$

$$\text{Calc: } \frac{100 \times 12^2}{10^2} = 144 \text{ lbs/ft on 10'}$$

Formula: Take the load of a known span times the span length squared and divide by the span desired squared.

Example: The load table shows 100 pounds per foot on a 12 foot span with a deflection of 1.5 inches. To find the load for a 10 foot span that is not in the table you take the load known (100) pounds times the span (12) foot squared then divide the answer (14,400) by the span desired (10) foot squared. The result is 144 pounds per foot on a 10 foot span. Do not calculate longer spans with this formula.

Part 2 Calculate the deflection for the new load of 144 pounds per foot on a 10 foot span:

Where

$$\text{Formula: } D_2 = \frac{W_1}{W_2} \times D_1$$

- D_2 = Calculated deflection for new load
- W_2 = 144 lbs/ft new 10' span desired load
- W_1 = 100 lbs/ft load in load table
- D_1 = 1.5" Deflection for 12 ' span 100 lb/ft load in table
- S = 12 Foot Span in Deflection Table

$$\text{Calc: } \frac{100}{144} = 0.6944 \times 1.5" = 1.0416"$$

Formula: Divide the new desired load for the 10 foot span by the known load for the 12 foot span and multiply the answer times the deflection for the known load on the 12 foot span.

Example: Take the load on the known span (100) pounds and divide by the new desired load (144) pounds. Take the result (0.6944) times the known span deflection (1.5) inches to get 1.0416 inches. The 144 pound load on a 10 foot span would have a deflection of 1.0416 inches. Catalog Deflections are based on simple beam support spans.

Request for Quote

For a working estimate, please provide the information requested below, along with a sketch of your system (optional) and fax both to MP Husky at (864) 234-4822. You will be contacted if more information is required. A completed estimate and proposal will be returned as soon as possible.

Other Technical Data

Depth:

4, 6, and 7

Fittings:

12, 24, or 36 inch standard radii (See Section 10 for details)

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.
(See Section 11 for details)

Safety Factor:

1.5 NEMA Standard

Rung Options:

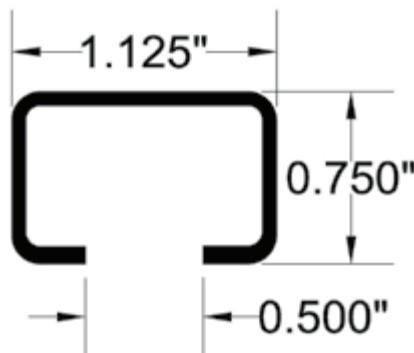

Flange-Out tray can be supplied with optional slotted rungs for ease of securing cables with tie wraps or accessories.

(For other tray sizes or specifications, please consult the factory)

Since it accommodates the most cable in the least space, Flange-In Husky Ladder is typically used in applications where strength and reliability are important, but space is limited.

3-FLANGE IN
LADDER

Other Technical Data

Depth:

3-3/8, 4, 6, 7, 8, and 10 inches nominal

Fittings:

12, 24, or 36 inch standard radii
 (See the Fittings Section 10 of this catalog for more information).

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.
 (See Section 11 for details)

Safety Factor:

1.5 NEMA Standard

Rung Options:

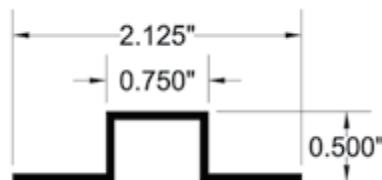

Flange-In tray can be supplied with optional slotted or strut type rungs for ease of securing cables with tie wraps, strut clamps or accessories.

(For other tray sizes or specifications, please consult the factory)

To ensure data available is most current, please visit www.MPHUSKY.com

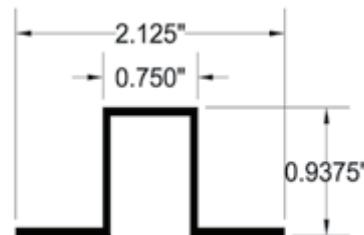

Rung Dimensions

6"-24" Wide Aluminum Ladder

6"-24" Wide Steel Ladder

30"-36" Wide Steel "HA" Style Ladder

30"-36" Wide Steel & Aluminum Ladder
 (Optional Steel Rung)

Example:
Part # S9XB7-24-144

| S | 9 | XB7- | 24- | 144 |
|----------|---------------------------|--------------|--------------------|---------------------|
| Material | Rung Spacing in Inches | Tray Type | Width in Inches | Length in Inches |

* = Load limit is limited by the load carrying capacity of the transverse member (rung).

**= Indicates the transverse member is a 15/16" hat shaped rung.

|----------------------------------|--|--|---|---|
| A | 9 | IMC- | 24- | 144 |
| Material | Rung Spacing | Tray Type | Width in Inches | Length in Inches |
| Materials: A= Aluminum | Rung Spacing: 6" 9" 12" 18" | Tray Types: IJA, IJB, IJC, IYA, IYB, IYC, IMB, IMC, IMD, IXA, IXB, IXC, IXD, I6, IXD7, I8 | Widths: 6" 9" 12" 18" 24" 30" 36" | Lengths: IJA, IJB, IJC, IMB, IMC and IMD available in 10' (120") & 12' (144") Only All others available in 10' (120"), 12' (144"), 20' (240") & 24' (288") I8 is also available in 30' (360") |

Other Technical Data

Depth:

4-1/2, 6, 7 & 8 inches

Fittings:

12, 24 & 36 inch radius

(See the Fittings Section 10 of this catalog for more information)

Splice Plates:

Bolted splice connectors (See Section 11 for details)

Safety Factor: 1.5

Rung Options:

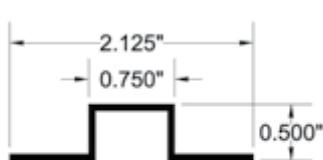

I-Beam tray can be supplied with optional slotted or strut type rungs for ease of securing cables with tie wraps, strut clamps or accessories.

(For other tray sizes or specifications, please consult the factory)

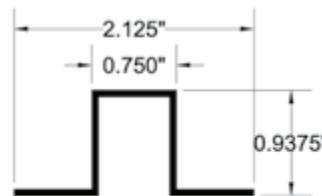

To ensure data available is most current, please visit www.MPHUSKY.com

Other Technical Data

Depth:

4-1/2, 6, 7, 8, & 10 inches nominal

Fittings:

12, 24, or 36 inch standard radii (See the Fittings Section 10 of this catalog)

Trough Bottoms:

All troughs 6" - 24" wide have corrugated ventilated bottoms. 30" and 36" wide have 4" rung spacing.

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.
(See Section 11 for details)

Safety Factor:

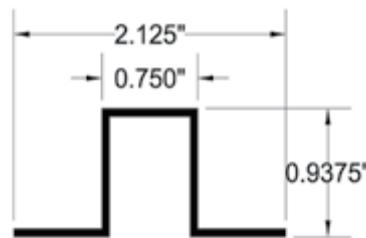

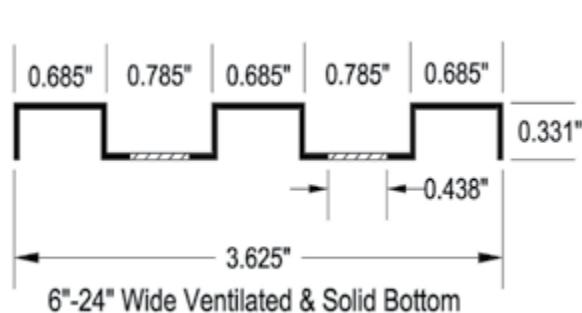

1.5 NEMA Standard

(For other tray sizes or specifications, please consult the factory)

To ensure data available is most current, please visit www.MPHUSKY.com

5-TROUGH

Other Technical Data

Depth:

4-1/2, 6, 7, 8, & 10 inches nominal

Fittings:

12, 24, or 36 inch standard radii
(See the Fittings Section 10 of this catalog)

Trough Bottoms:

All troughs 6" - 24" wide have solid corrugated bottoms. 30" and 36" wide have (-06C) solid bottom.

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware. (See Section 11 for details)

Safety Factor:

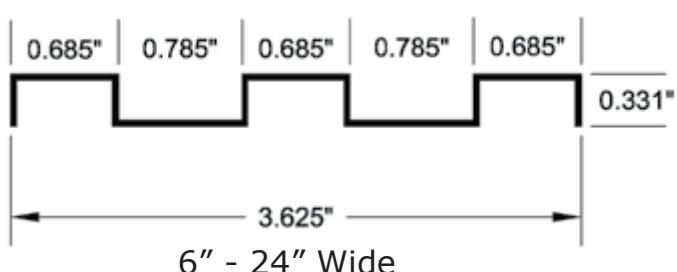

1.5 NEMA Standard

(For other tray sizes or specifications, please consult the factory)

5-TROUGH

Other Technical Data

Depth:

3-3/8, 4, 6 & 7 inches nominal

Fittings:

12, 24, or 36 inch standard radii (See the Fittings Section 10 of this catalog)

Trough Bottoms:

All troughs 6" - 24" wide have ventilated corrugated bottoms. 30" and 36" wide have 4" rung spacing.

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware. (See Section 11 for details)

Safety Factor:

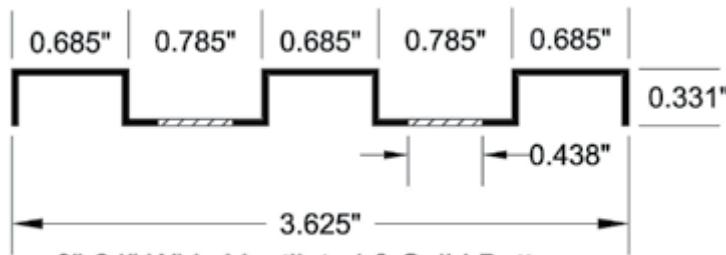

1.5 NEMA Standard

(For other tray sizes or specifications, please consult the factory)

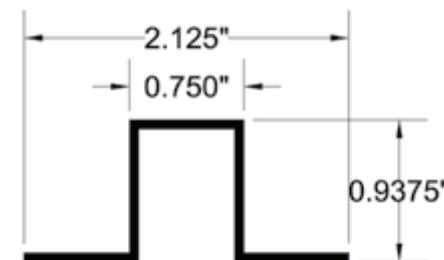

To ensure data available is most current, please visit www.MPHUSKY.com

Other Technical Data

Depth:

3-3/8, 4, 6 and 7 inches nominal

Fittings:

12, 24, or 36 inch standard radii (See the Fittings Section 10 of this catalog)

Trough Bottoms:

All troughs 6" - 24" wide have solid corrugated bottoms. 30" and 36" wide have (-06C) solid bottom.

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.
 (See Section 11 for details)

Safety Factor:

1.5 NEMA Standard

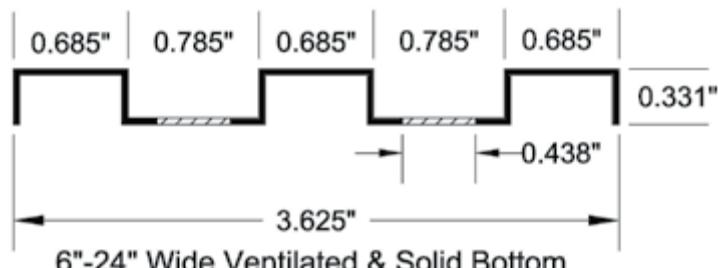

(For other tray sizes or specifications, please consult the factory)

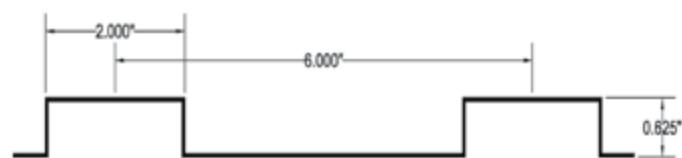

Please see Section 7 (Husky Way) for our other solid bottom tray designs.

To ensure data available is most current, please visit www.MPHUSKY.com

Other Technical Data

Depth:

4-1/2, 6, 7 & 8

Fittings:

12, 24 & 36 inch radius (See the Fittings Section 10 of this catalog)

Trough Bottoms:

Corrugation on 6-24 inch wide, 4 inch rung spacing on 30 & 36 inch wide

Splice Plates:

Bolted Splice Plates (See Section 11 for details)

Safety Factor:

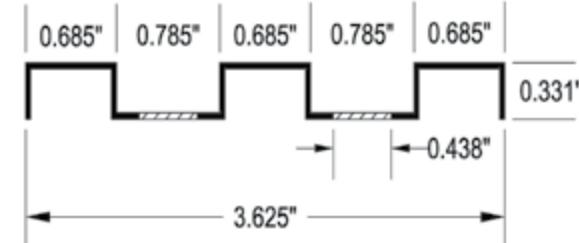

1.5

(For other tray sizes or specifications, please consult the factory)

Husky Way

Solid Bottom Tray System

For most widths of tray, Husky Way is a one piece formed pan that provides a flat bottom and a fill depth that is almost the same as the outside height of the tray. Husky Way is available in 3-3/8", 4" and 6" deep styles and can be manufactured from Aluminum, Mill-Galvanized, Galvannealed, 304 or 316 Stainless Steel Material.

The solid bottom design provides total support for cables adding protection. Husky Way can be totally enclosed by adding covers (sold separately) to protect cables from damage, aid in shielding or just for a clean appearance. Husky Way is available in widths from 6" wide through 36" wide.

Aluminum—light weight, maintenance free and non-magnetic. Electrical losses are kept to a minimum with this material, but it does not provide shielding for cables from magnetic fields.

Mill-Galvanized Steel—economical, offering good corrosion resistance, and providing shielding from magnetic fields in an enclosed solid bottom system with cover.

Galvannealed Steel—offers the features shown above, plus it is well suited to painting. Galvannealed trays can be painted to match the building color scheme so that it blends in with its surroundings. This system also provides electromagnetic shielding.

Stainless Steel—this material is ideal for corrosive areas, however, because of its non-magnetic feature, it will not provide shielding for sensitive instrument and control or data cables.

We offer a complete line of fittings, covers, accessories, and support items for the Husky Way System to aid in installation and routing.

*An Economical & Easy to Use Cable
Tray from MP Husky—**the Leader in
Cable Tray Systems***

7-HUSKY WAY

Other Technical Data

Depth:

3-3/8, 4, 6

Fittings:

12, 24 or 36 inch standard radii

(See the Fittings Section 10 of this catalog for more information).

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.
 (See Section 11 for details)

Safety Factor:

Husky Way is manufactured and tested in accordance with NEMA VE-1.
 The tables on the following pages have a 1.5 safety factor.

(For other tray sizes or specifications, please consult the factory)

To ensure data available is most current, please visit www.MPHUSKY.com

NOTE: Cover sold separately

Husky EMI Enclosed Tray

EMI - Electromagnetic Interference Protection

With the widespread use of computerized processing equipment in industrial facilities, the minimization of interference induced in the communication link between the in-plant transducers or primary elements and controllers is critical. Depending upon the installation, this link, in most cases a pair of electrical conductors, may be very short, or run for several hundred feet. The longer the control signal cable, the more susceptible it is to induced electrical noise. Shielding these cables with a copper braid or metallic tape will protect them from each other, but for long runs a better method of shielding is necessary for protection against external interferences. To shield these cables individually is impractical because of the large number used in a complex industrial control system. Numerous control signal cables can be protected from interference by using a properly designed and shielded enclosure.

Undesirable voltage can be induced into the control signal cables by five methods:

1. Electrostatic Fields
2. Electromagnetic Fields
3. Plane Wave Radiation
4. Cross Talk
5. Common Mode

Cross talk and common mode interference are functions of the control circuits themselves and must be handled through the proper selection of cable and grounding methods. Plane wave radiation, which is of concern at very high frequencies (30MHz), is generally not a problem in the typical industrial or utility environments.

Electrostatic and Electromagnetic fields are important and directly influence the selection of shield cable enclosures.

Electrostatic interference is caused by stray capacitance between the control signal cable and other conductors and machinery in the area. This stray capacitance can be reduced by completely enclosing the control signal cable in a shielded enclosure which is a good electrical conductor. The measure of electrical effectiveness in this situation is the electrostatic attenuation. This attenuation is determined by measuring the undesirable induced voltage in the control signal cable within the shielded cable enclosure. The enclosure must be properly grounded if it is to act as an electrostatic field.

EMI - Electromagnetic Interference Protection

Electromagnetic interference is caused by the mutual inductance between the control signal cables and other surrounding power cables and machinery. This mutual inductance can be reduced (shielding the control cable) if the control signal cable is completely enclosed in a good magnetic material. An electromagnetic attenuation parameter can be defined in the same manner as the electrostatic attenuation. Unfortunately, good electrical conductors are not effective magnetic (high permeability) materials. The converse is also true. In most industrial installations, shielding must be provided against both electrostatic and electromagnetic fields. Thus a compromise must be made.

The attenuation parameters (electrostatic and electromagnetic) may be measured under laboratory conditions. A test setup is used to create the proper type of field, and the induced voltage "e¹" in a control signal cable is measured with the cable suspended in free air. Then the test is repeated with the control signal cable enclosed in the shielded enclosure and the induced voltage "e²" is measured. The shielding effectiveness is given by the ratio of these voltages.

$$S = \frac{e^1}{e^2}$$

The greater the ratio, the better the shield. Due to the wide dynamic range of "S" for different types of shields, the attenuation is usually expressed as twenty times the logarithm to the base ten of "S".

$$A = 20 \log_{10} S$$

or

$$A = 20 \log_{10} \text{to } \frac{e^1}{e^2}$$

The attenuation parameters are both functions of frequency and therefore are usually shown by a graphical display of "A_s". (Electrostatic Attenuation) and "A_m" (Electromagnetic Attenuation) plotted versus frequency.

Protection of Process Control and Instrumentation Cable

The type of signal transmitted by the primary element to the controller determines how sensitive the signal is to extraneous electrical interference. For example, the lower the voltage the higher the impedance and the more susceptible the circuit is to interference.

Since most process type primary elements operate at low voltages and amperes, care must be taken when electing shielding requirements. Typical levels of operation range between less than 100MV to 5V on voltage type elements and 1MA to 50MA on current systems.

Many companies who utilize automated process control find that high additional costs are incurred in eliminating interference in systems, not in the installation, but rather in the check-out and start-up stages of construction.

Protection of Process Control and Instrumentation Cable

Most of the additional cost can be eliminated in the engineering stages by proper selection of cable and EMI enclosures. The following guidelines will ensure the most acceptable method of installing instrumentation:

- A. Use twisted parallel pairs - shielded and grounded.**
- B. Separate control wires by frequency and voltage level.**
- C. Route control circuits to avoid power cables and machinery.**
- D. Install control cable in a Husky EMI enclosure.**
- E. Ground the shielded EMI enclosure.**

Husky EMI enclosures offer excellent attenuation characteristics while providing a low cost economical installation that allows for additional control cables, check-out and re-wiring. (See Figures 1 and 2 on the following page)

High Voltage Station Switchyard Control Cable Protection

For switchyards with primary system voltages of 230KV and above, control and instrumentation cables must be protected from induced voltages that can cause control cable insulation breakdown and damage to control components. This problem becomes more acute when solid state devices, which are even more susceptible to damage by over-voltage, are used on new installations.

The interfering induced voltages are caused by surge voltages which are either continuous wave or impulse wave types. The over voltages are present due to periodic transients, switching surges, circuit breaker or GAP flashover. Typically, induced voltages on the control cables can be in the order of 10-15KV if not adequately shielded. A shielded control cable enclosed in an EMI enclosure offers the best overall protection and provides economies in cable installation. EMI enclosures facilitate the placement of control cables above ground where rewiring or additions can be added without the high costs and corrosion problems associated with underground methods.

Tests conducted at a special high voltage test facility demonstrated that Husky's EMI enclosures offer exceptional protection by attenuating the high surge voltages to acceptable levels.

| Surge Voltage | Without Enclosure* | | With EMI Enclosure ** | |
|---------------|--------------------|---------|-----------------------|----------|
| | Type A | Type B | Type A | Type B |
| 600 KV | 7.3 KV | 2.9 KV | 51 Volts | 17 Volts |
| 1000 KV | 16.9 KV | 10.4 KV | 53 Volts | 26 Volts |
| 1400 KV | 24.8 KV | 16.0 KV | 113 Volts | 23 Volts |

Type A - Control cable with copper tape and drain wire

Type B - Control cable with lead shield

*Shield floating

**Shield grounded at both ends

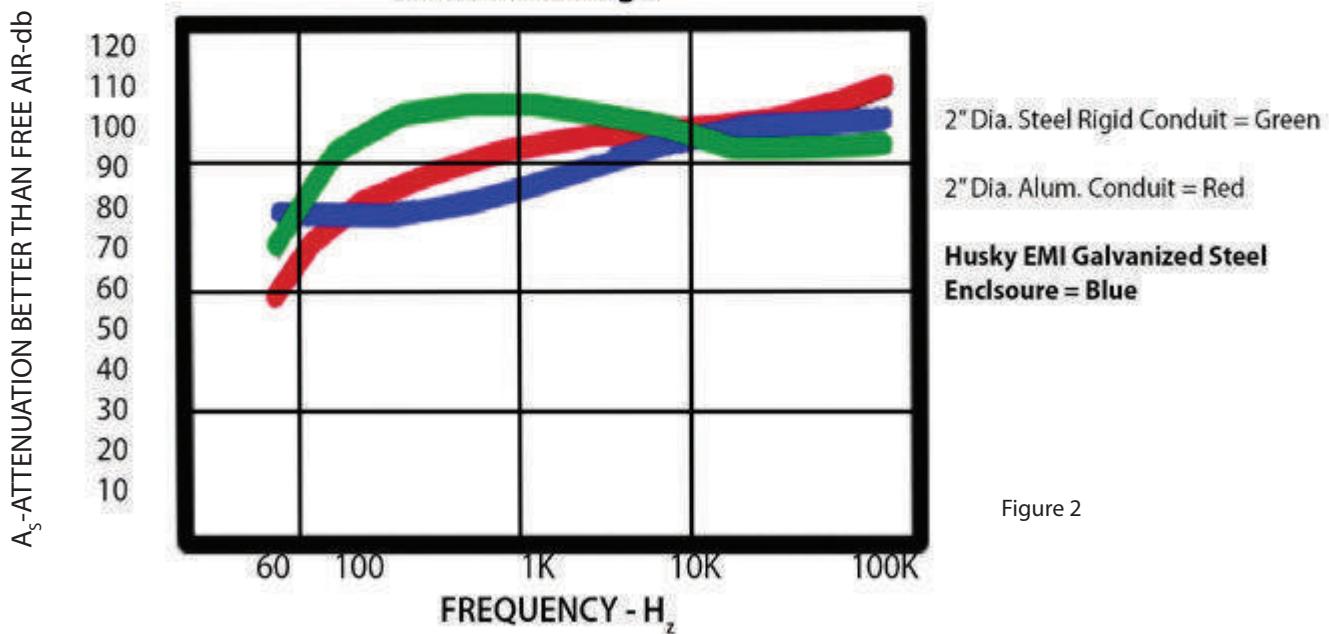

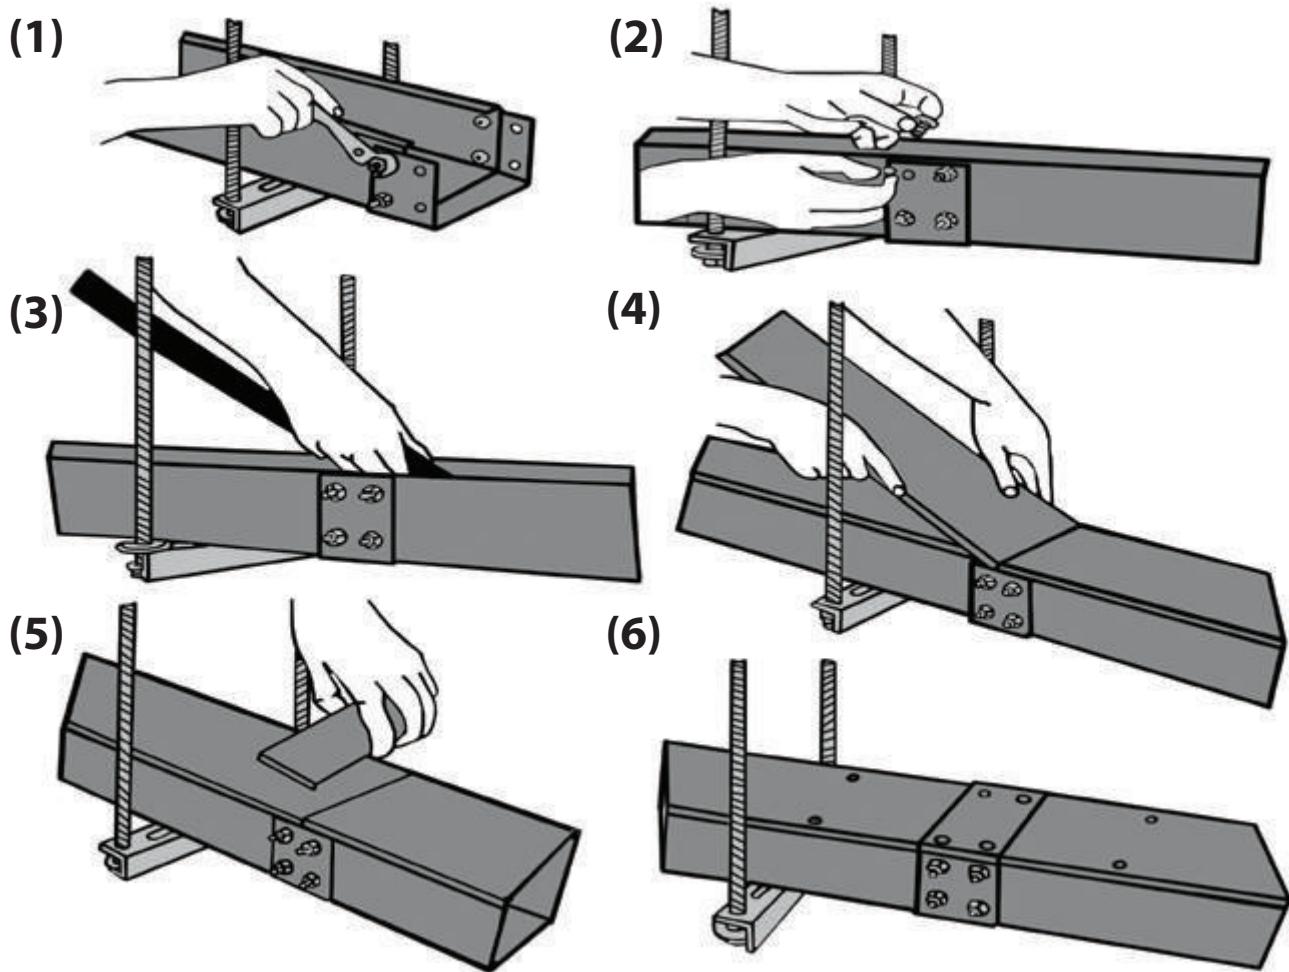

Figure 2

Installation Instructions

Husky EMI enclosures can be installed using the same conventional practices and supports associated with standard cable tray.

1. After the support material is in place, clamp the EMI enclosure to the support structure.
2. When joining sections of EMI enclosures use the lower half of the two piece wrap-around splice to connect the sections (1) and (2).
3. After all cables have been installed in the EMI enclosures (3), fasten covers in place (4), making sure that the upper half (or cover) for the wrap-around splice is placed over and secured to the butting enclosure covers (5).
4. EMI enclosure covers should be fastened down on two foot centers to maintain the Husky recommended attenuation (6). By decreasing the cover hold-down centers to one foot, an increase in attenuation of 2db would be realized across the frequency spectrum.

Specification for Husky EMI Enclosures

1.0 General

1.01 Scope

This specification shall include all the necessary materials to provide an EMI enclosure system with a high degree of electrostatic and electromagnetic shielding for low level control circuits. The enclosures shall be designed and constructed to equal or better the EM-shielding attributes herein specified, over the frequency range of 60 Hz to 100 KHz.

1.02 Basic Design

To meet the requirements of this specification the cable tray and cover must totally enclose the specified cables, circuits, and/or devices with metal. Non-metallic materials are not acceptable for this purpose.

2.0 Attenuation Requirements

2.01 Electrostatic Attenuation

The minimum acceptable electrostatic (electric field) shielding efficiency for the enclosure to be supplied for this installation shall be 86 db in the range of 60Hz to 100 KHz.

2.02 Electromagnetic Attenuation

The minimum magnetic field shielding efficiency shall increase from 9 db to 55 db over the frequency range of 60 Hz through 100 KHz.

2.03 Certification

The enclosure manufacturer shall certify in writing that the EMI enclosure to be provided will, in fact, equal or better the shielding efficiency of Paragraphs 2.01 and 2.02. Such certification will consist of a report of evaluation tests performed by the manufacturer or by an independent testing laboratory. The report will describe the enclosure, the test methods used to evaluate the product and technical data (graphics, charts, etc.) supporting the shielding performance claims for the product.

3.0 Additional Requirements

3.01 General

In addition to the above attenuation requirements, it is intended that the completed EMI enclosure system be readily accessible for installation, re-arrangement, and inspection of cables supported. Additionally, the enclosure provided shall meet the following electrical and mechanical requirements.

3.02 Electrical Continuity and Grounding

All components of the enclosure system shall be thoroughly grounded to conform with the grounding requirements of the N.E.C. A bare copper bonding cable shall be installed in the enclosure to provide adequate grounding continuity. Each section of the enclosure and all fittings shall be securely bonded to the ground bus in the enclosure with suitable grounding fitting to ascertain continuity to ground throughout the enclosure system.

3.03 Material Specifications

All members of the enclosure system, unless specifically stated herein, shall be made from ASTM A653-G90 Steel, and all EMI enclosures shall be hot-dip mill galvanized. Application of design rules and fabrication shall be in accordance with ASTM Specifications and A.W.S. Standards. The hot-dip galvanize protective covering shall conform to ASTM Standards.

3.04 Approval of EMI Enclosure

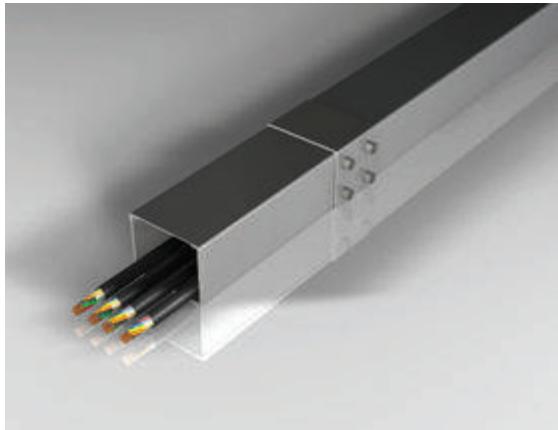

The Contractor shall submit for approval, as soon as practical and within thirty days after the award of contract and before the purchase of material, a complete schedule of the materials and equipment proposed for installation, including the specified data. Data to be submitted for approval shall consist of the Manufacturers name and the following items for each type of enclosure to be furnished: Typical Sample, Certified Attenuation Data .

TRAY

Other Technical Data

Material:

ASTM-A653 G90 Steel

Standard Finish:

Hot-dip mill-galvanized. (Other finishes available upon request)

Parts Included:

Each straight includes cover, wrap-around splice, hardware and self-drilling cover screws.

Other:

EMI is manufactured and tested in accordance with NEMA VE-1 and is installed in accordance with NEMA VE-2 "Cable Tray Installation Guidelines".

(For other tray sizes or specifications, please consult the factory)

Cover Holding Devices

Catalog No. B-26 (Phillips Head)

Catalog No. B-55 (Hex Head)

All holding devices should be located on 2 foot centers, or less.

Standard - Self drilling sheet metal screws.

Optional Holding Devices

Banding - Available in 302 Stainless Steel, is an economical way of securing the cover to the enclosure.

| Item | Catalog Number |
|---------------------|----------------|
| 100' roll 1/2" wide | SCCB-100 |
| Clips - 1/2" wide | SCCB-C |
| Strapping Tool | CCB-T |

Clamps

Permit the easy removal of cover and access to cable. Reusable.

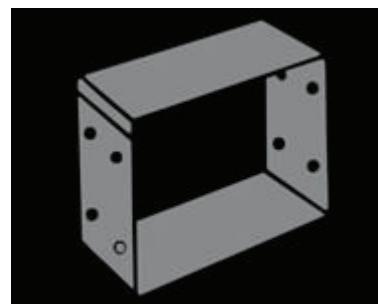

| Length | Catalog Number |

Other Technical Data

Depth:

1-3/4 inches outside with a loading depth of 1-5/8 inches inside.

Fittings:

12, 24, or 36 inch standard radii (See this section of this catalog).

Channel Bottoms:

All channels have flat bottoms and are available with or without ventilation holes. All fittings are non-ventilated.

Splice Plates:

Straight sections and fittings are supplied with splice plates and hardware.

Safety Factor:

1.5 NEMA Standard

Example Fitting for S6YD, S9YD, S12YD

| SLYD-24H90-24 | | | | |
|--|--|--|--|--|
| Prefix | Basic Part Number | | | |
| SLYD- | 24 | H | 90- | 24 |
| Tray Fitting Prefix Prefix Determined By Chart Below and Based on Straight Tray Prefix | Tray Width 6", 9", 12", 18", 24", 30", 36" | Bend H=Horizontal VI=Vertical Inside VO=Vertical Outside T=Tee VT=Vertical Tee VTU=Upside-Down Vert. Tee VS=Vertical Support 90° X=Cross R=Straight Reducer RL=Left Hand Reducer RR=Right Hand Reducer | Degree of Bend 30°, 45°, 60°, or 90° | Fitting Radius 12", 24" or 36" |

To Determine Fitting Catalog Number (Prefix + Basic Part Number):

- Select prefix of type of Cable Tray required for your application from Catalog pages below:

Aluminum

| | |
|-------------------|----------|
| Flange-In Ladder | Page 113 |
| Flange-Out Ladder | Page 113 |
| I-Beam Ladder | Page 113 |
| Husky Way | Page 113 |
| Trough | Page 114 |
| I-Beam Trough | Page 114 |

Steel

| | |
|-------------------|--------------|
| Flange-In Ladder | Page 115-116 |
| Flange-Out Ladder | Page 115-116 |
| Trough | Page 115-116 |
| Husky Way | Page 116 |
| EMI | Page 116 |

- Use selected Cable Tray prefix in the Fitting Prefix Selection Tables below to select the corresponding fitting prefix.
- Go to Pages 117-134 in this section to find the desired fittings and select the Basic Part Numbers that correspond to the required fittings.
- Add fitting prefix to basic part numbers to complete product catalog numbers (example above).

Numbering System (cont'd)

Numbering System

Insert the Fitting Prefix—Each cable tray has a corresponding prefix which is used to determine the complete fitting part number. Use this table to locate the correct prefix. To assemble the part number select prefix and then add Basic number from charts on following pages.

Reducing Splice Plates

Offset Splice Plates for Concentric and Eccentric Reductions

Reducing splice plates are used instead of reducer fittings and offer better versatility and economy since they are less expensive and do not require covers.

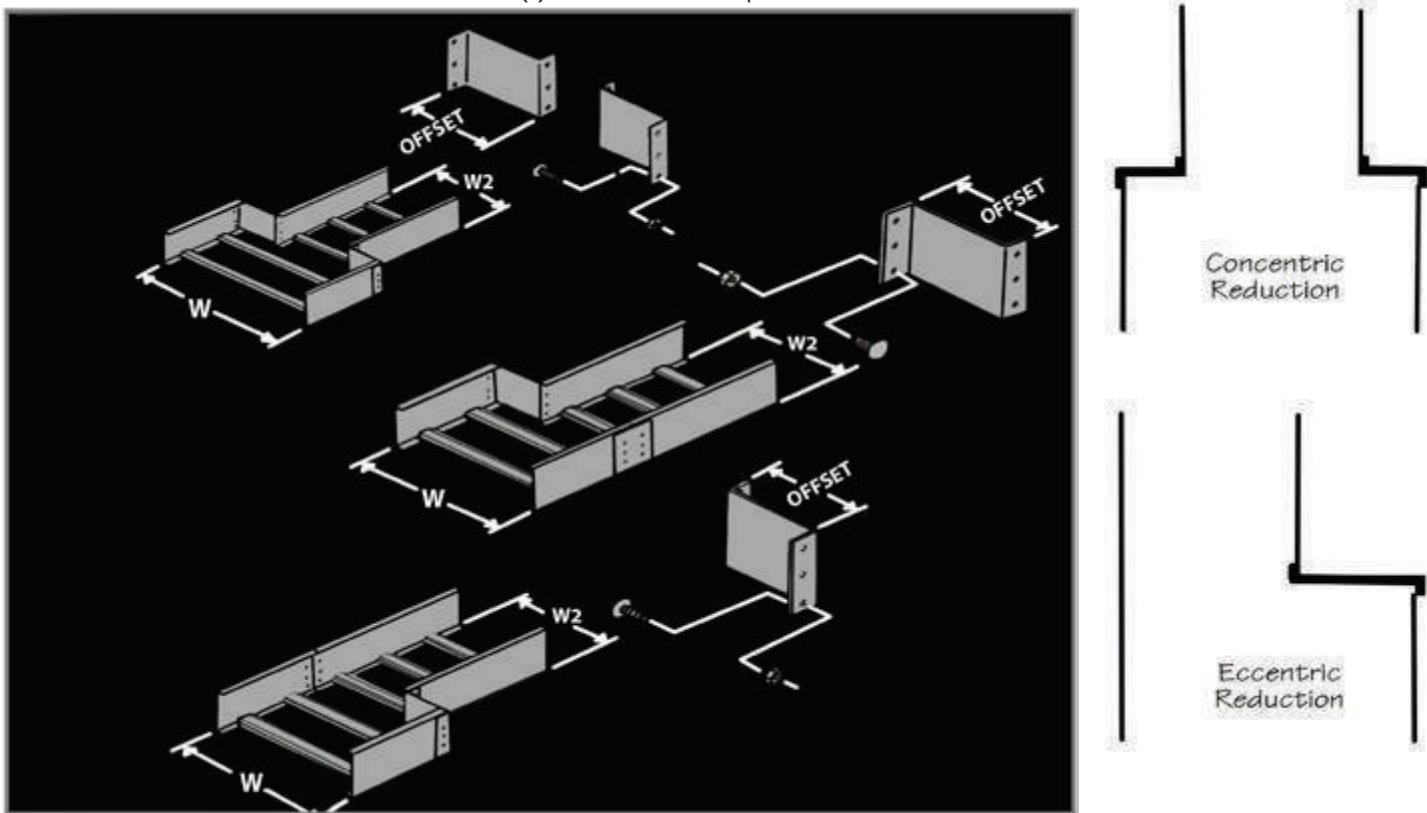

(Hardware is included)

For concentric reductions, two plates of equal offset are used. For eccentric reductions, one plate is used along with a standard splice connector (not included).

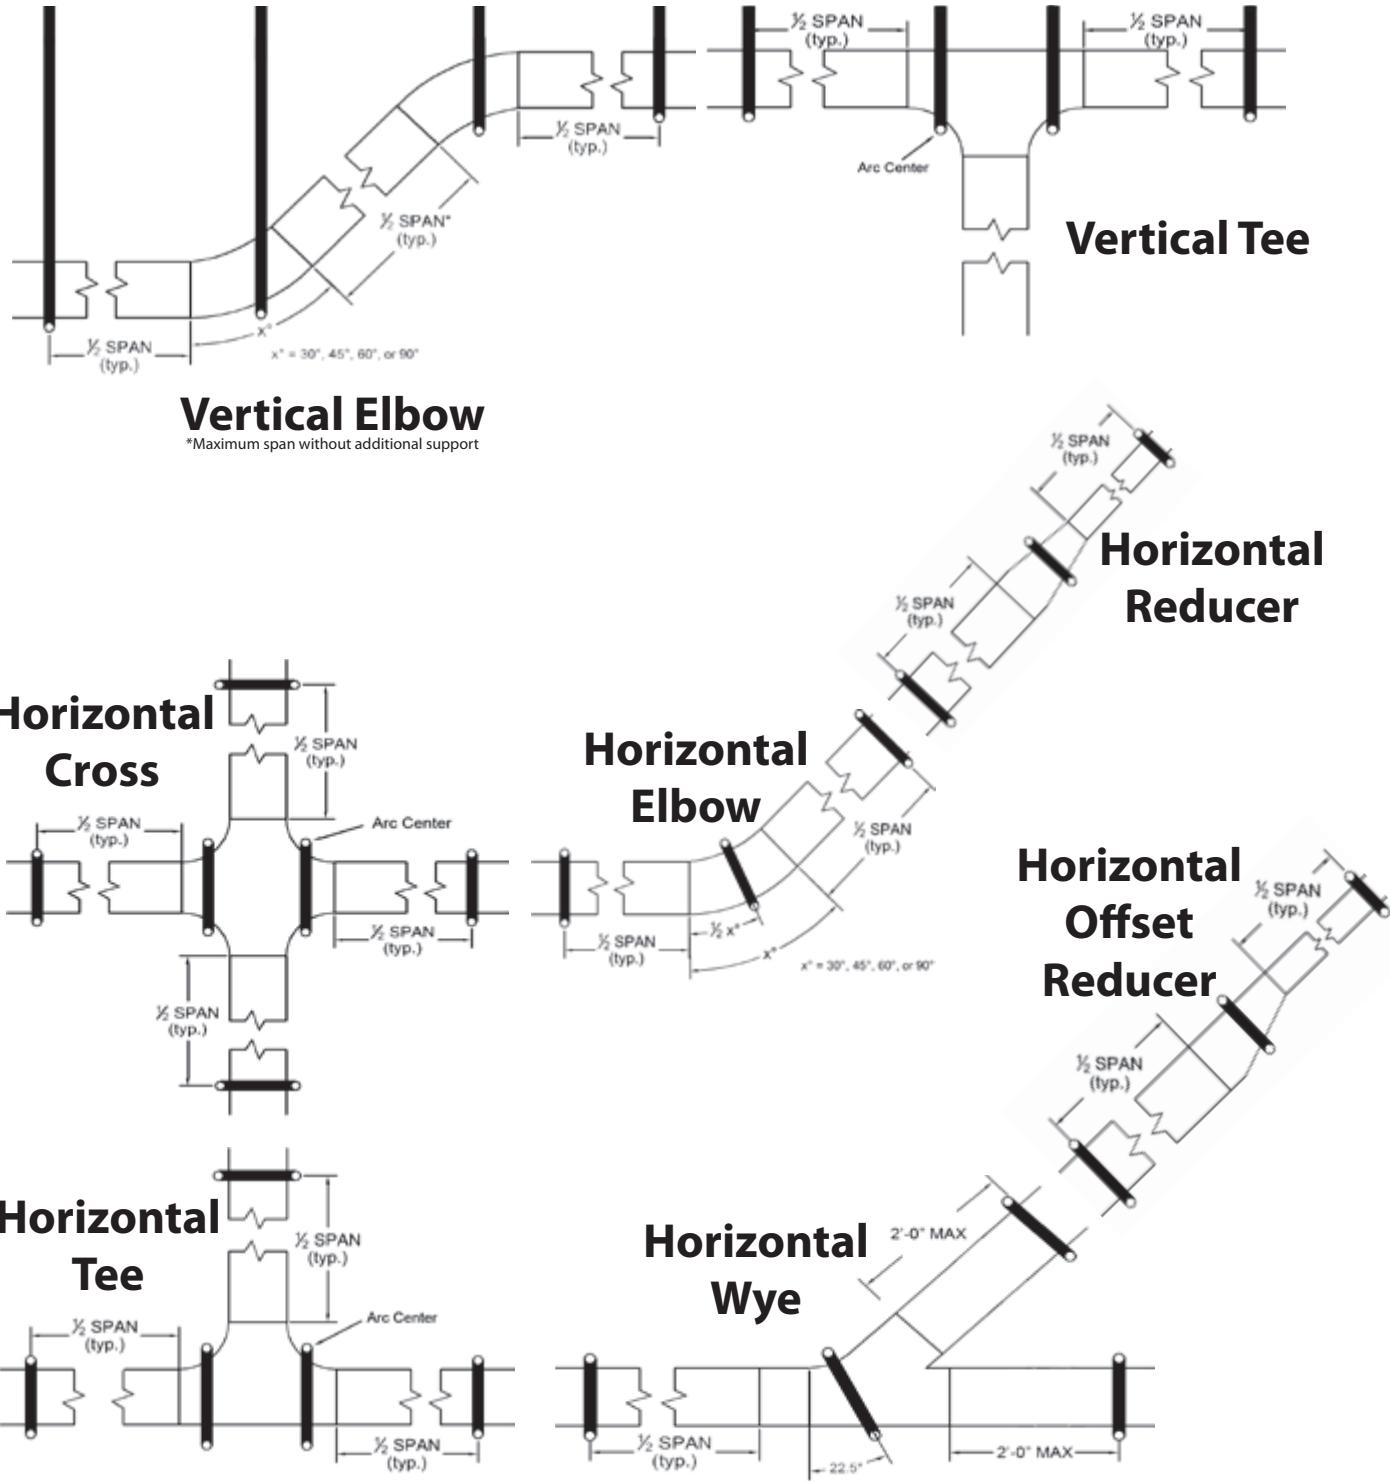

| Tray Depth | Aluminum | HDGAF Steel | Stainless Steel 304 | Stainless Steel 316 | Galvannealed (Husky Way) |
|---------------------|--------------|--------------|---------------------|---------------------|--------------------------|
| 3-3/8", 4", 4-1/2" | ASP-HOR-() | SSP-HOR-() | 4SP-HOR-() | 6SP-HOR-() | NSP-HOR-() |
| 6" & 7" (Except I6) | ASP-XOR-() | SSP-XOR-() | 4SP-XOR-() | 6SP-XOR-() | NSP-XOR-() |

() = Insert offset of plate in inches.

Alternate Fitting Support Locations

Diagrammed below are fitting support locations as tested with specially constructed NEMA 20C cable tray fittings as an alternative to the support locations diagrammed in NEMA VE-2. Please consult the factory prior to ordering if you intend to support the cable tray in this manner.

Universal Splice Connectors for All Straight Sections and Fittings

These connectors are furnished with trays and are also available to purchase separately, if required for field cuts. Sold as EACH. (Hardware included)

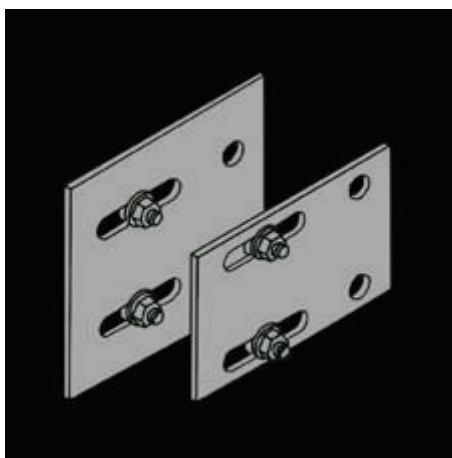

Note: Add 1B to the catalog number for a splice plate with MP Husky hole pattern on one side and a blank side for field drilling to match another make tray system.

Expansion Joint Splice Plates

Expansion splice plates for Ladder or Trough are designed to allow 1-1/2" free movement between adjacent straight lengths. When using expansion splices, it is important that the straight run be fixed permanently to its support at the approximate center between expansion joints whenever possible, and that all other points be supported in a manner that the longitudinal expansion is not restricted. Supports should be provided within one foot on each side of an expansion joint to ensure its proper functioning. Sold as EACH. (Hardware included)

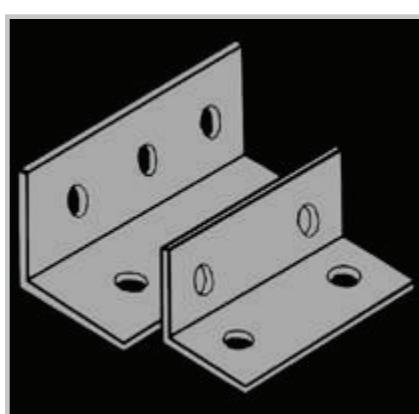

TIP: See NEMA VE-2 for proper installation instructions regarding frequency of use and setting the gap during installation.

Bonding jumpers required.

**Step Down Splice**

Used to connect 6"-7" tray to 3-3/8"- 4-1/2" tray (Except I6).
(Hardware included)

| Alum. | HDGAF | SS 304 | SS 316 | Galvannealed (Husky Way) |
|---------|---------|---------|---------|--------------------------|
| ASP-MH2 | SSP-MH2 | 4SP-MH2 | 6SP-MH2 | NSP-MH2 |

Horizontal

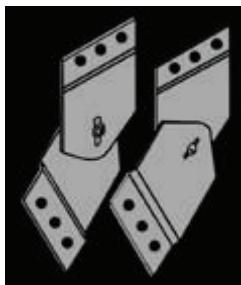

NOTE: Only for use with an angle of 30° or less

Channel ---

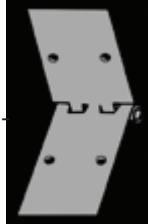

**Hinged Splices**

Horizontal and vertical hinged splices offer field flexibility to go around pipes, ducts, and other obstacles that occur during installation. Electrical continuity is maintained by using bonding jumpers such as AFS-C, which are purchased separately. Hinged splices for Ladder or Trough come in sets of two. Hinged splices for 4" and 6" Channel come as single units. Horizontal hinged splices require field drilling of the long hinge member and all hinged splices require additional supports, as they are not considered to be full strength mechanical splices. Sold in PAIRS. (Hardware included)

() = Insert Tray Width

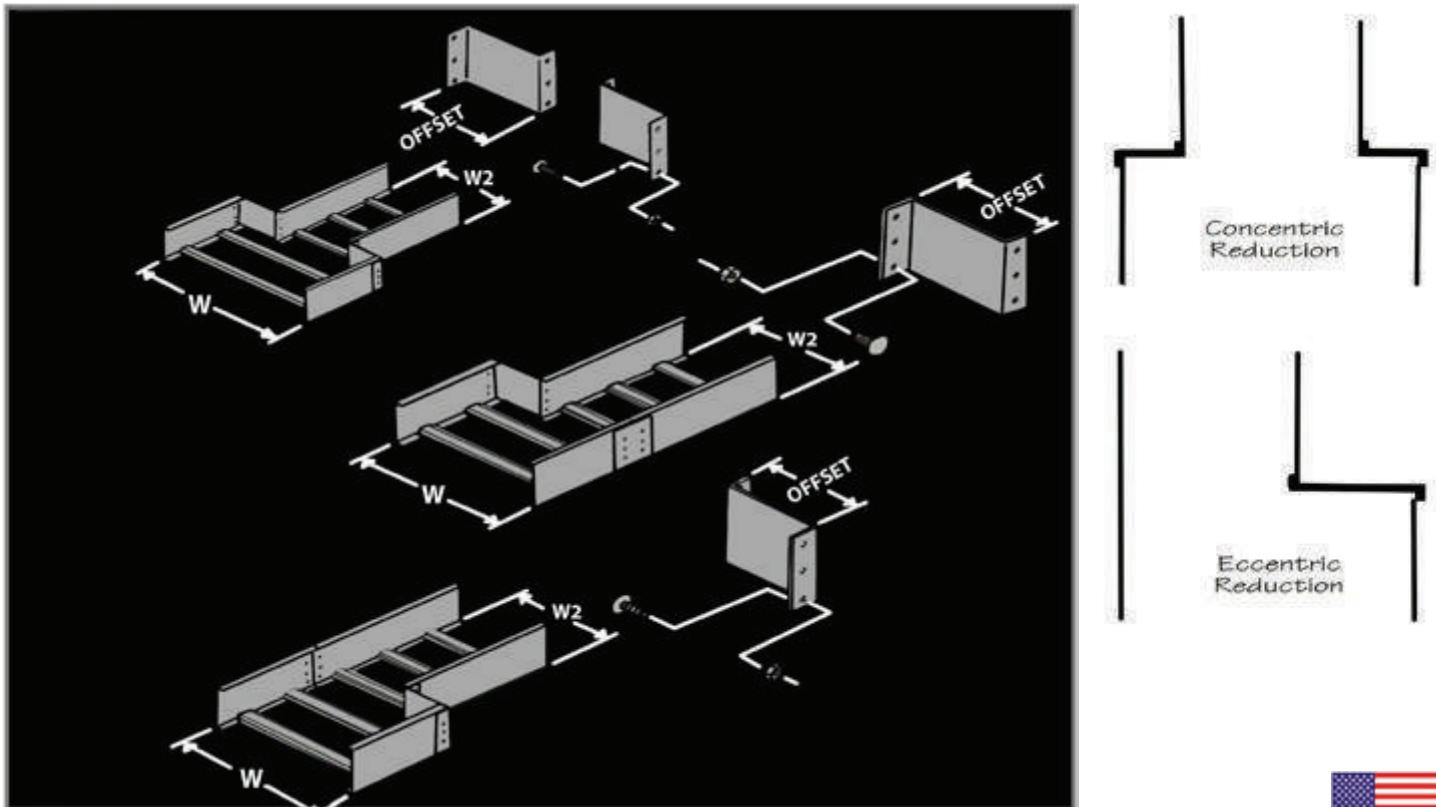

Offset Splice Plates for Concentric and Eccentric Reductions

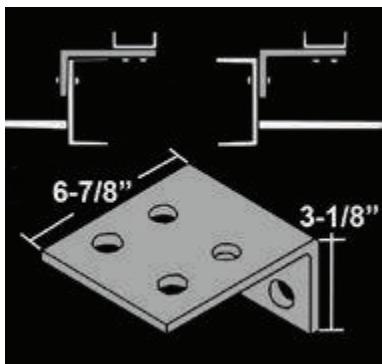

Reducing splice plates are used instead of reducer fittings and offer better versatility and economy since they are less expensive and do not require covers. For concentric reductions, two plates of equal offset are used. For eccentric reductions, one plate is used along with a standard splice connector, not included. (Splice hardware is included)

() = Insert offset of plate in inches.

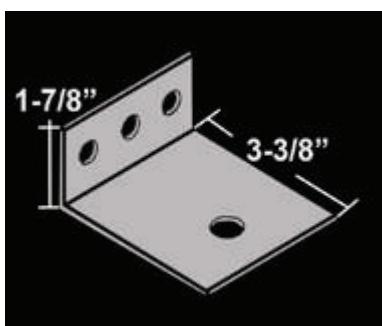

Trough and Ladder to Single Channel Connectors For All Trays

These connectors take a single Channel off a Ladder or Trough sideways or downward.
(Hardware included)

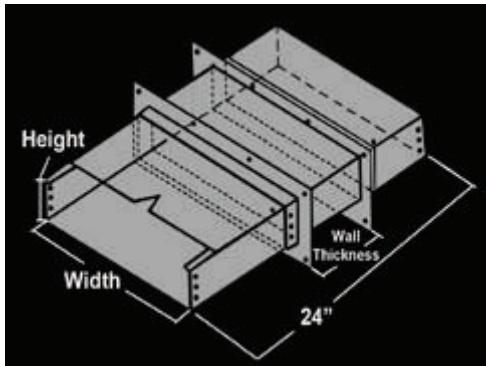

| Channel Type | Alum. | HDGAF | SS 304 | SS 316 | Galvannealed (Husky Way) |
|--------------|--------|--------|--------|--------|--------------------------|
| G4,G6 | ACC-GU | SCC-GU | 4CC-GU | 6CC-GU | NCC-GU |

Structural Connector For Ladders and Trough

Structural connectors terminate Ladder or Trough on top of concrete floors. Tray hardware is included. Use 1/2" hardware at floor connection.

| Channel Type | Alum. | HDGAF | SS 304 | SS 316 | Galvannealed (Husky Way) |
|--------------|-------|-------|--------|--------|--------------------------|
| All Trays | ASC-U | SSC-U | 4SC-U | 6SC-U | NSC-U |

Wall Penetration Sleeve

The wall penetration sleeve is a 24" long pan with wall flanges, cover & cover screws, that allows tray to be connected on both sides of the wall. Gaskets and sealants (not included), may be applied in the field.

(W)=insert Width
(D)=insert Depth

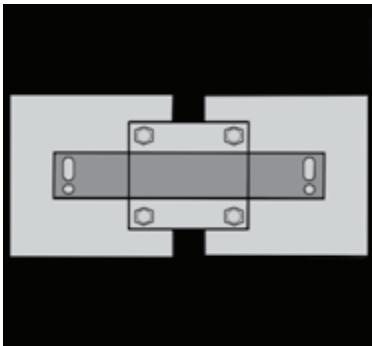

| Channel Type | Alum. | Mill-Galv. | HDGAF | SS 304 | SS 316 | Galvannealed (Husky Way) |
|--------------|--------------|--------------|--------------|--------------|--------------|--------------------------|
| All Trays | AWPS-(W)-(D) | PWPS-(W)-(D) | SWPS-(W)-(D) | 4WPS-(W)-(D) | 6WPS-(W)-(D) | NWPS-(W)-(D) |

Hardware for Splice Connectors

Splice hardware is offered in standard zinc plated steel finish, or in 316 stainless steel to withstand corrosive attack under many atmospheric conditions.

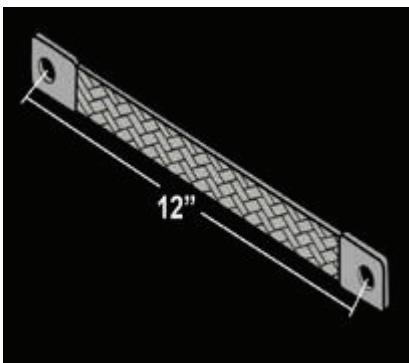

| Hardware Item | Plated Steel | SS 316 |
|-------------------------|--------------|----------|
| 3/8" Splice Bolt | B-100 | B-100-6S |
| Splice Nut/Washer Comb. | N-100 | N-100-6S |

Bonding Jumpers

Bonding jumpers are available to maintain electrical continuity across hinged and expansion splices. The aluminum jumpers are used with oxidation inhibitor under the contact points. The short circuit rating is 600 Amperes. Hardware included. Sold as each.

| |
|----------------|
| Catalog Number |
| AFS-C |

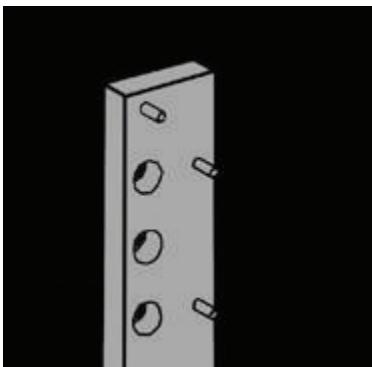

Bonding Jumper/Grounding Strap

Tin plated braided copper. 12" long hole to hole.

Hardware Included

| Tray Type | Catalog Number |
|---|---|
| All Trays Except Husky Centray | AFS-CT-600 (600 amps) #1 AWG AFS-CT-1000 (1000 amps) #2 / 0 AFS-CT-1200 (1200 amps) #3 / 0 AFS-CT-1600 (1600 amps) #4 / 0 AFS-CT-2000 (2000 amps) 250 KCMIL |
| Husky Centray Center Spine & Wall Mount | AFS-CT-600-CR (600amps) #1 AWG AFS-CT-1000-CR (1000 amps) #2 / 0 AFS-CT-1600-CR (1600 amps) #4 / 0 |

Drill Jigs

Using drill jigs on field-cut ends ensures the proper alignment of holes, allowing full design strength of the splice. A splice plate can also be clamped to the side rail and used as a template for a small quantity of field cuts.

| Tray Depth | Catalog No. |
|------------|-------------|
| 3-3/8" | VDJ |
| 4" | JDJ |
| 4-1/2" | KDJ |
| 6" | MDJ |
| 6-1/4" | XBDJ |
| 7" | MDDJ |
| 8" | L1DJ |
| 10" | D1DJ |

Note: These drill jigs are for C-Channel rails and will not work on I-Beam type trays.

Oxidation Inhibitor

An oxidation inhibitor is used where permanent electrical continuity is important. For best results, clean connecting surfaces from dirt and oil by wiping clean and removing oxide coating by abrasion once over with emery cloth. Apply a thin coat of oxidation inhibitor on the cleaned surfaces and make connection immediately. Each container of compound is sufficient to effect approximately eighty splices.

| |
|----------------|
| Catalog Number |
| OI |

*Above part numbers are for 1 each.

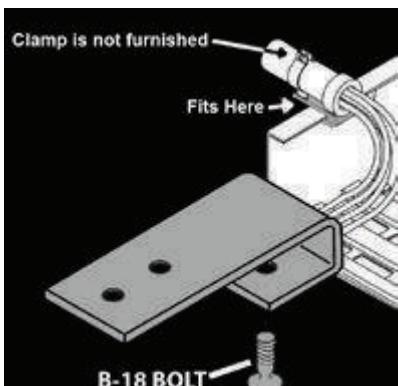

End Dropout

This dropout is used at the end of a cable tray system, or to provide a smooth drop off for small cables or any point between the rungs in the ladder system. It can be used in pairs, where dropping cable from both directions, or singly, when dropping cable in one direction. Hardware Included.

()=insert width
Hardware included.
Part # is for 1 each.

**Conduit Side Type Dropouts**

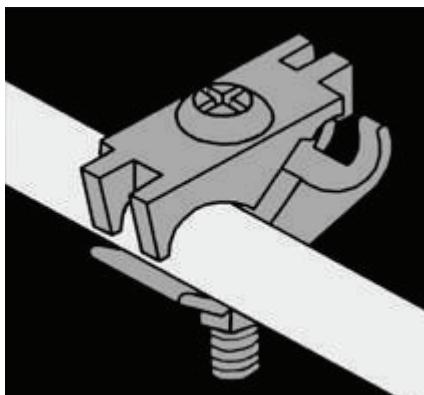

The conduit side type dropout is a bracket used to secure a conduit clamp (not included), to the side rail of the tray, allowing cables to exit the tray into conduit drops to the equipment.

| Tray Type | Zinc Plated | SS 304 | SS 316 | HDGAF |
|-----------|-------------|--------|--------|--------|
| All Trays | VDS-U | 4VDS-U | 6VDS-U | GVDS-U |

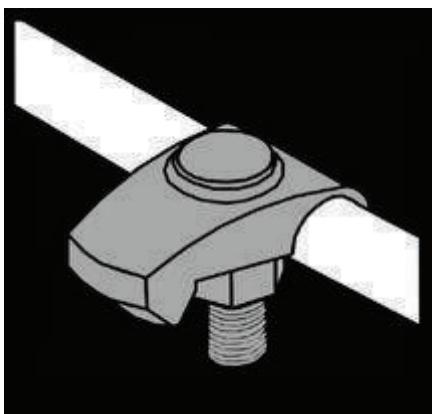

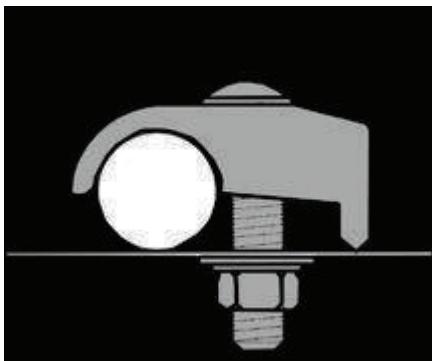

Part # is for 1 ea.

**Grounding Connectors**

Type GC Connectors hold a single through cable and a tap cable while separating the ground conductor from the cable tray surface. Note that the bolt head is mounted on the inside wall of the cable tray to avoid damage to the cable insulation. Grounding connectors may be used with aluminum or galvanized steel cable trays and aluminum or copper conductors. When mounted horizontally, the bolt may be used to replace one of the bolts in a splice plate, eliminating the need to drill the tray. When used on aluminum conductors the cable must be scratch brushed and Oxidation Inhibitor (OI) must be used on the cable and connector. Clamps are tin plated.

| Conductor | Catalog No. |
|--|-------------|
| #6(SOL),#4,#3,#2,#1 & 1/0 STR (.162-.372 Dia) | GC-2525-CT |
| #2 Sol, #1, 1/0 & 2/0 STR (.258-.419 Dia) | GC-2626-CT |
| 2/0 (STR),3/0, 4/0, 250KCMIL (.414-.575 Dia) | GC-2929-CT |

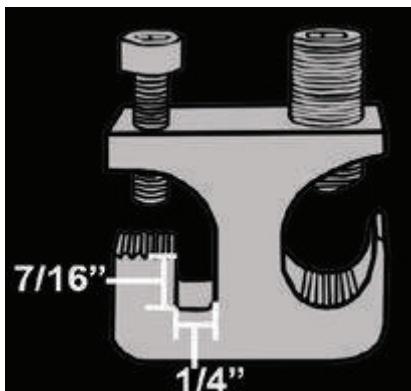

Grounding Clamps

Type GBM high copper alloy Clamps hold a single through cable directly on the cable tray surface. One wrench installation and UL467 listed. Copper alloy cast body with Durium bolts, nuts and washers.

GB style clamps have a back piece that separates the cable from the tray surface. GB style not shown.

| Conductor | GBM Catalog No. | GB Catalog No. |
|-------------------------------------|-----------------|----------------|
| #4 (SOL), #3, #2, #1, 1/0 & 2/0 Str | GBM-26G3 | GB-26G3 |
| 2/0 (SOL), 3/0, 4/0 & 250MCM | GBM-29G3 | GB-29G3 |
| 300, 350, 400 & 500MCM | GBM-34G3 | GB-34G3 |
| 550-750MCM | GBM-39G3 | GB-39G3 |

These copper clamps are furnished in copper alloy, however tin plating is available as an option.

Grounding Clamp (NEW)

Ground Clamp for fastening ground wire to Cable Tray or Cable Bus. Clamp is tin plated extruded aluminum with Zinc Electroplated Steel hardware. Use for aluminum or copper conductors. Clamp has serrations to bite through insulating oxides on aluminum tray and grip the tray. Screws tighten with 1/4" hex wrench.

Third Party Certification:

UL Listed E-24264

CSA Certified LR9795 (for copper conductors only)

Applicable Third Party standards:

UL Standard 467

CSA Standard C22.2 No. 41

NEC 250.77 and 392.6

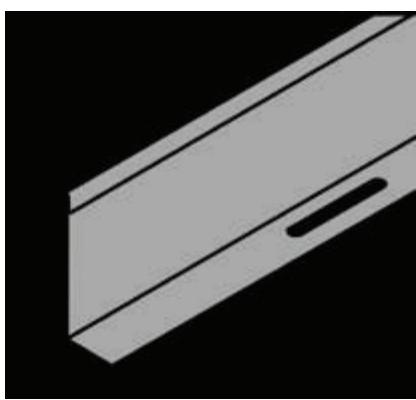

| Conductor | Catalog No. |
|--|-------------|
| #6, #4, #3, #2, #1, 1/0, 2/0, 3/0, 4/0 AWG to 250KCMIL | HP-CTGC |

Double Grounding Clamp (NEW)

This zinc plated Double Grounding Clamp is used to clamp ground wire to the tray or structure. The hole is 5/16".

| Cable Size | Catalog No. |
|------------|-------------|
| 5/16" | HCM-28 |
| 3/8" | HCM-29 |
| 1/2" | HCM-30 |

For 10 ft lengths, change the -144 to -120 on the end of the part number.

For 6 ft. lengths, use -72

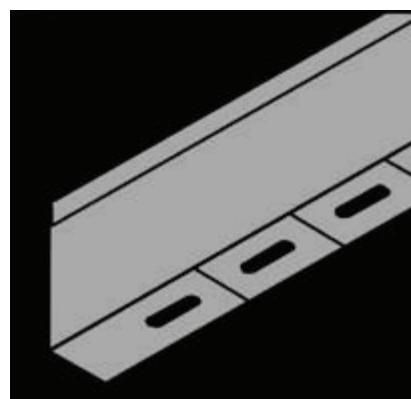

For 5 ft. lengths, use -60

Cable Separators / Divider Strips

Cable separators (divider strips) are available for all tray types in aluminum, HDGAF, mill-galvanized, galvannealed and 304 or 316 stainless steel. Separators come in either 3", 5", 6", 7", 8", or 10" heights and are slotted at regular intervals for ease of installation without field drilling. Each separator is furnished with all necessary splice clips and the required number of nuts, bolts, and captive lock washers. Separator Rung Fasteners must be ordered separately for attachment to Ladder rungs without drilling. One (CSS) separator splice included with each.

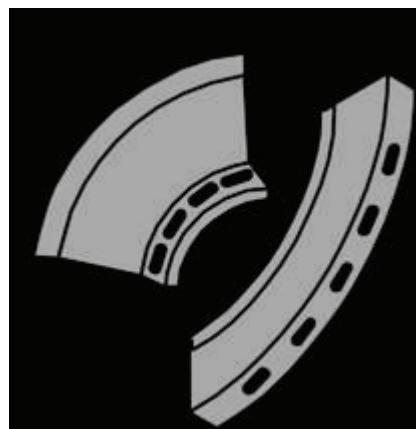

Straight Lengths: Standard length is 10 or 12 feet. HDGAF will be provided in lengths no longer than 72". The grouping of slots is designed to fit the hole pattern of MP Husky corrugated ventilated Troughs and Ladder Rungs.

| Sep Hgt | Tray Hgt | Alum. | Mill-Galv. | SS 304 | SS 316 | HDGAF | Galvan. (Husky Way) |
|---------|---------------|---------|------------|---------|---------|--------|---------------------|

| 6-3/4" | A7S-HA | --- | --- | --- | --- | --- |
| 8-3/4" | A9S-HA | --- | --- | --- | --- | --- |

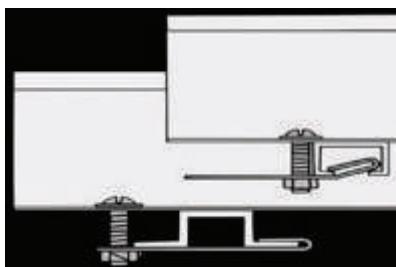

For Vertical Bends: Vertical separators must be factory formed to the proper radius needed. Vertical separators can be ordered to the degree of bend or the customer can order all 90° separators and field cut them to the proper degree bends. One (CSS) separator splice included with each.

The following information is required at the time of order:

1. Inside or outside bend
2. Type of material
3. Degree of bend
4. Radius of bend
5. Separator height

Example: A3V-VI45-24

Mini Trim

Mini trim can be used as a protective edging to protect cables from sharp surfaces that cables may contact. Mini trim is a vinyl embossed extrusion with a segmented metal core that can be cut with a knife between the metal core segments. It will grip edges from .010" to .050" thick, and is supplied in 100 ft. and 250 ft. rolls in black.

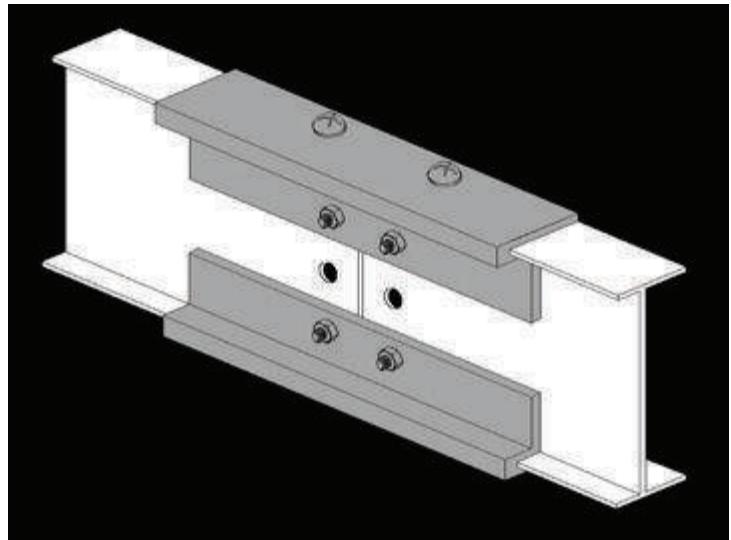

| Length | Catalog Number |
|---------|----------------|
| 100 ft. | MINI TRIM-100 |
| 250 ft. | MINI TRIM-250 |

MP Husky Mid-Span Splice (NEW)

MP Husky's Mid-Span Splice option provides the ability to place a splice at any point within the support span without diminishing the load rating of certain tray types based on an installation of 3 spans or more. Requires some field drilling. (Hardware Included)

| Catalog Number |
|----------------|
| ASP-MS-() |

() = insert tray height

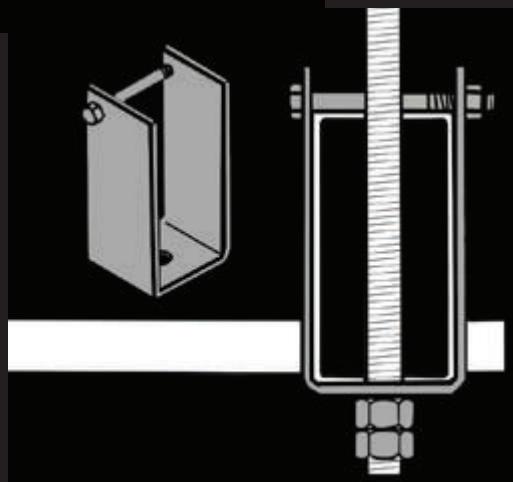

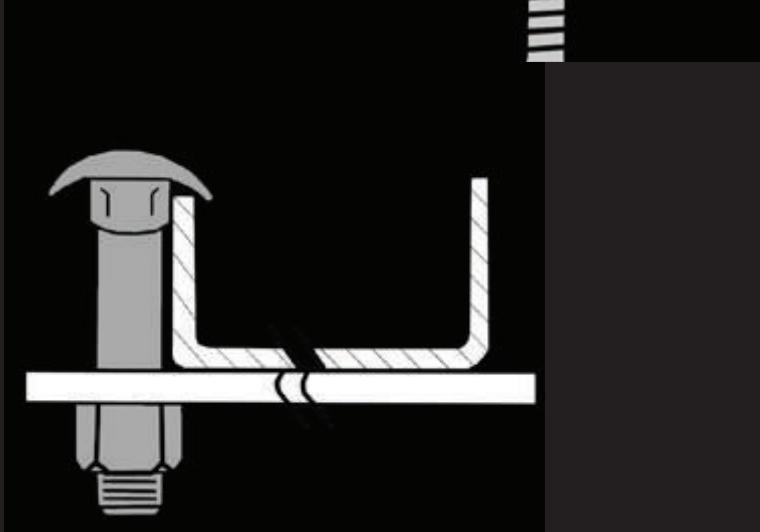

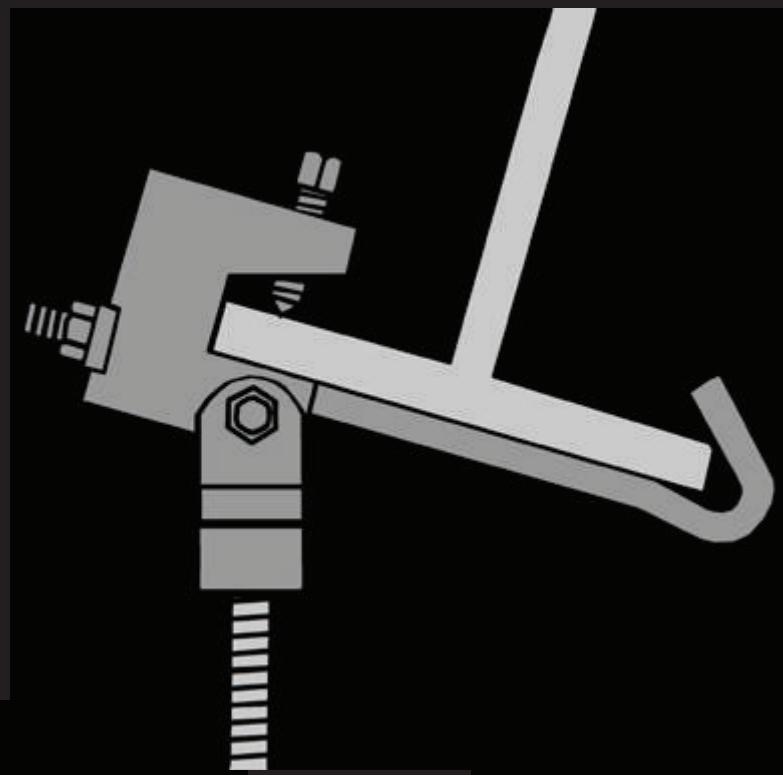

NOTE: Please contact manufacturer for list of approved tray types

Trapeze Support Kits

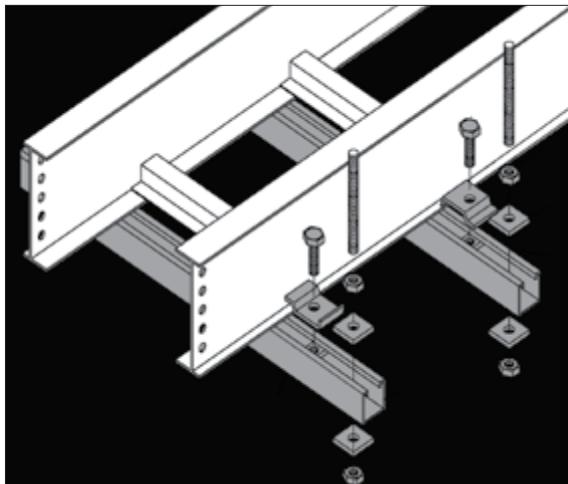

These trapeze support kits include all the hardware needed to attach various types of trays to 1/2" threaded hanging rods (rods not included). Included with each kit is the strut, hold down clips with spring nuts and bolts, and washers and nuts needed to attach to threaded rod. There is also an option to use double strut, which is one piece of strut welded to the bottom of another for added strength.

Hanger Rods Not Included

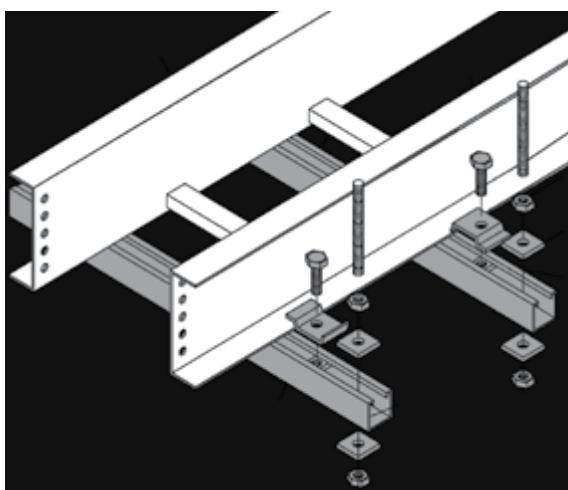

Example: TSHP200- (insert tray width)-1

| FLANGE-IN TRAPEZE SUPPORT | | |

Hanger Rods

1/2" diameter, 13 threads per inch hanger rods can be used with all tray support channels, angles and hanger clips. They have continuous threads and are furnished with 4 (N-12) nuts, 2 (W-9) lock-washers and 2 (W-12) flat washers.

Maximum allowable load:

Use for design, 1100 lbs., in combination with all standard suspension fittings, hanger clips, and couplings normally used. The safe load is much higher.

| Item | Plated Steel | Stainless 316 |
|--------------------|--------------|---------------|
| 10'0" Hanger Rod | HR-120G | 6HR-120G |
| 5'0" Hanger Rod | HR-60G | 6HR-60G |
| 2'-6" Hanger Rod | HR-30G | 6HR-30G |
| Extra Hex Nuts | N-12 | N-12-6S |
| Extra Lock Washers | W-9 | W-9-6S |
| Extra Flat Washers | W-12 | W-12-6S |

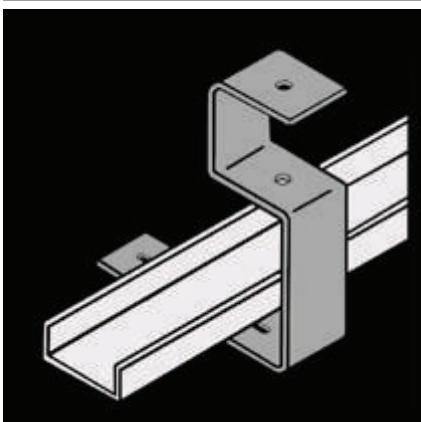

Trapeze Support Angles

Angles are continuously slotted to hold down Husky Trough using HB-1 bolts, and can be used to support all tray types with 1/2" hanger rod suspended from overhead.

Maximum allowable load:

Will safely support any loaded tray of the designated width within the load limits of the hanger rod.

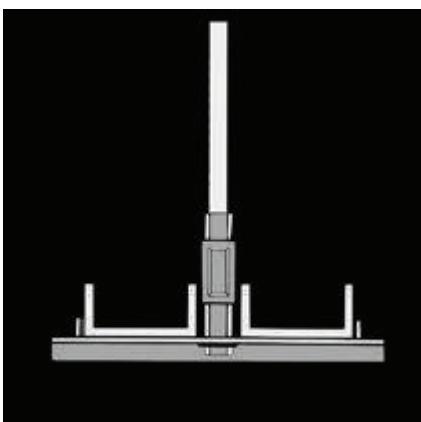

| Tray Width | HDGAF |
|------------|---------|
| 36" | STSA-36 |
| 30" | STSA-30 |
| 24" | STSA-24 |
| 18" | STSA-18 |
| 12" | STSA-12 |
| 9" | STSA-9 |
| 6" | STSA-6 |

Single Channel Hangers

Single channel hangers are used to support single 4" or 6" wide Husky Channels from 1/2" hanger rod. The bottom support member, on which the channel rests, is drilled to accommodate HB-10 hold-down bolts, or SGB-GU expansion guide bolts.

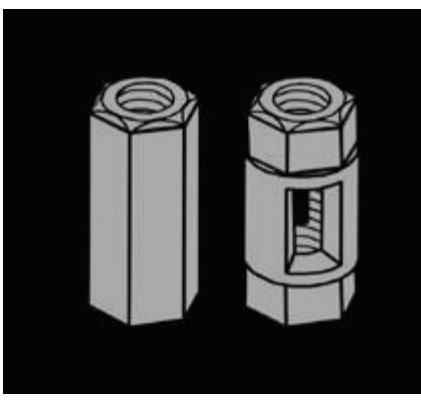

| Channel Type | HDGAF | SS 304 | SS 316 |
|--------------|-------|--------|--------|
| 4",6" | SH-GU | 4SH-GU | 6SH-GU |

Double Channel Hangers

Double hangers support double, 4" or 6" wide Husky Channels from 1/2" hanger rods. The support member, on which the channel rests, is drilled to accommodate HB-10 hold-down bolts, or SGB-GU expansion guide bolts.

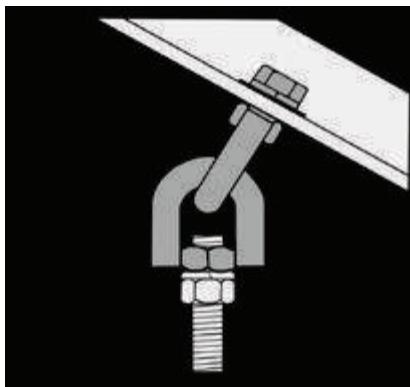

| Channel Type | HDGAF | SS 304 | SS 316 |
|--------------|--------|---------|---------|
| 4" | SH-2G4 | 4SH-2G4 | 6SH-2G4 |
| 6" | SH-2G6 | 4SH-2G6 | 6SH-2G6 |

Hanger Rod Couplings

Couplings are used to connect hanger rods when lengths of more than 120" are encountered or to connect rods between trays that are hung one over the other. They also reduce field labor costs by extending new or existing hanger rods to support additional trays.

| Item | Plated | SS 304 | SS 316 |
|---------------------------------|--------|--------|--------|
| 1/2" Steel w/o Window | HRC | 4HRC | 6HRC |
| 1/2" Malleable Iron with Window | HRC-G | -- | -- |

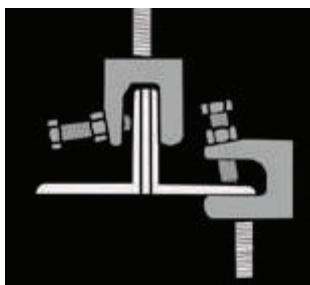

Swivel Joints

Swivel joints allow 1/2" hanger rods to swing from an inclined clamp. They are furnished with or without a 1 inch stud assembly.

| Item | Plated | SS 304 | SS 316 |
|------------------------|--------|--------|--------|
| Swivel Joint Only | SJ | 4SJ | 6SJ |
| Swivel Joint With Stud | SJS | 4SJS | 6SJS |

Maximum allowable load:
1500 lbs.

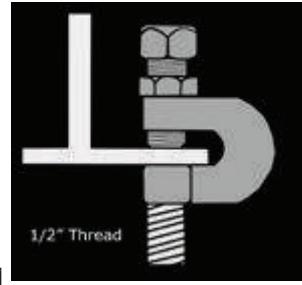

Beam Clamps

Beam clamps have 1/2" holes to attach hanger rods to a beam flange or to support channels. Furnished in unfinished iron.

Maximum allowable load:

1000 lbs.

| Flange Thickness | Catalog No. |

Beam C-Clamps

C-Clamps allow for the direct support of hanger rods on I-beams, wide flange beam sections and angles and are supplied in unfinished iron.

Maximum allowable load:
400 lbs.

| Catalog No. |
|-------------|
| GC |

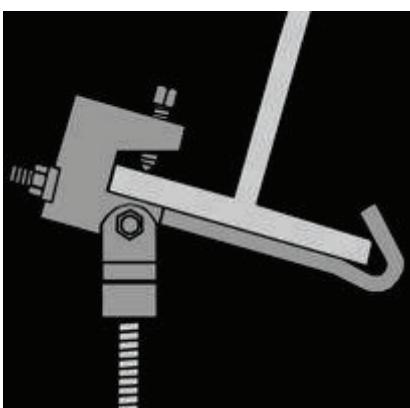

I-Beam Clamp

This wide-flanged clamp is furnished with or without a hook bolt in lengths to accommodate 6" through 12" wide beams up to 3/4" thick.

Maximum allowable load:

300 lbs.

| Item | Plated Steel | SS 316 |
|-------------------|--------------|-------------|
| Clamp Only | PS-2622 | 6PS-2622 |
| Clamp w/Hook Bolt | | |
| Less than 6" | PS-2622-6 | 6PS-2622-6 |
| 6"-10" | PS-2622-10 | 6PS-2622-10 |
| 10"-12" | PS-2622-12 | 6PS-2622-12 |

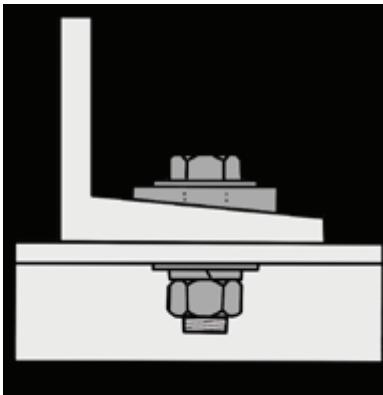

I-Beam Clamp w/Swivel

This is standard I-Beam Clamp with a hook bolt and swivel clevis.

Maximum allowable load:

300 lbs.

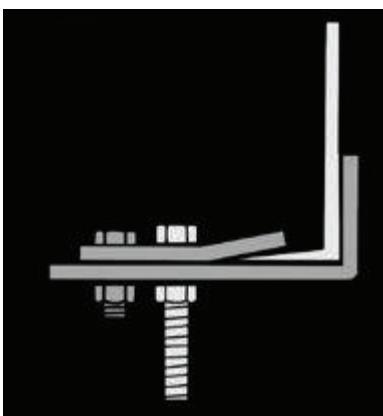

| Item | Plated Steel | SS 316 |
|-------------------|--------------|---------------|
| Clamp Only | PS-2622SJ | 6PS-2622SJ |
| Clamp w/Hook Bolt | | |
| Less than 6" | PS-2622SJ-6 | 6PS-2622SJ-6 |
| 6"-10" | PS-2622SJ-10 | 6PS-2622SJ-10 |
| 10"-12" | PS-2622SJ-12 | 6PS-2622SJ-12 |

Bevel Washers

The standard size is 1-1/4" square with a 1/2" bevel and a 9/16" hole. Bolt and nut not included.

| |
|-------------|
| Catalog No. |
| W-11 |

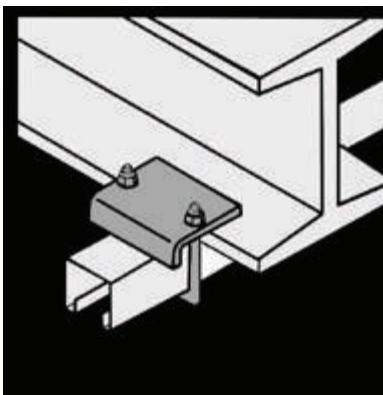

Channel Clamps

Channel clamp assemblies can be used on all American Standard channels with a flange width of 3-1/4" or less. They are furnished in zinc plated steel with or without a swivel joint.

Maximum allowable load:

500 lbs. with a safety factor of 5

| Item | Zinc Plated Steel |
|----------------------|-------------------|
| Clamp Only | HP-177 |
| Clamp w/Swivel Joint | HP-177SJ |

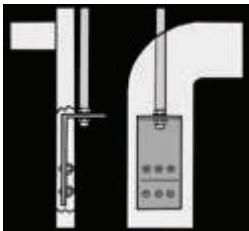

HP Channel Clamps

HP single and back to back strut type support channels are attached to structural beams with a 0.8" maximum flange thickness. Clamps are furnished with the required hardware.

Maximum allowable load:

1,275 lbs. with a safety factor of 5

| Channel Type | Zinc Plated Steel |
|---------------------|-------------------|
| HP-200 Single Strut | HP-265A |
| HP-201 Double Strut | HP-265D |

Vertical Hangers For Tray

| TRAY | HDGAF | SS 316 |
|------------------------------|----------|-----------|
| All Tray Except I6,I8,8",10" | SH-VU | 6SH-VU |
| I6,8",10" | SH-VU-I6 | 6SH-VU-I6 |
| I8 | SH-VU-I8 | 6SH-VU-I8 |

Vertical hangers support single-type vertical ladders or troughs from 1/2" hanger rods. Each is furnished with the required mounting hardware. The hanger is generally used to splice the vertical tray and VO90 together and support the tray. (Hanger rod not included)

Maximum allowable load:

250 lbs. per unit

Vertical Hangers For Channel

| HDGAF | SH-VGU |
|--------|---------|
| SS 316 | 6SH-VGU |

This hanger assembly for vertical channels accommodates either 4" or 6" wide channels and is furnished with all necessary hardware, except for the top 1/2" hanger rod to the building steel.

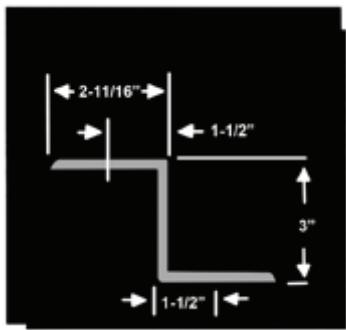

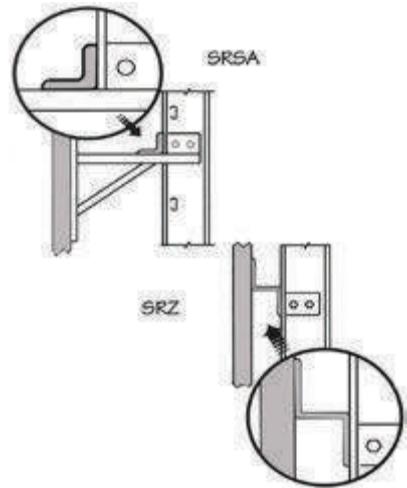

Maximum allowable load:

200 lbs.

There is a wide variation of vertical run supports possible, depending on the load, support spacing and distance of the run from the wall or supporting structure. It is recommended that support spacing for vertical runs be no less than six feet and no more than twelve feet. Brackets are available for spacing of 3, 12, 24 and 36 inches from the wall to accommodate the various radii bends that may be entering or leaving the supporting wall.

Vertical runs usually consist of either a Z-Bracket for a 3 inch distance from the wall only, or a pair of brackets with the necessary support angles and clips to fasten the tray to the support. Here are two typical installations:

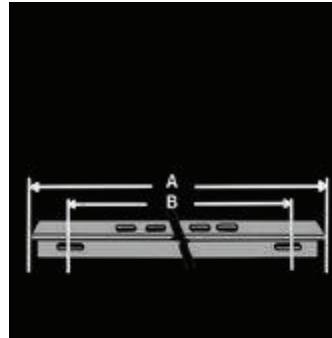

In addition to wall brackets, the proper support angle and number of bracket angle clips for the tray to be used must be determined. For each application, the actual load per bracket must be checked against the maximum allowable load on the bracket.

Z-Brackets

Z-Brackets support vertical runs at a distance of 3 inches from the wall. They have a slot pattern similar to that of bracket angles and are made from standard 7 gauge Z-shaped HDGAF steel.

Note: A & B dimension locations shown on bracket angle.

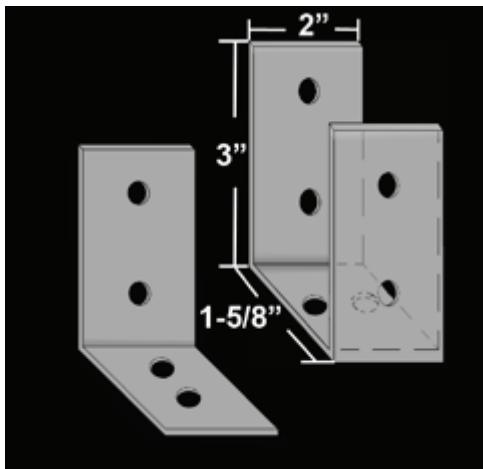

Bracket Angles

Bracket angles connect two wall brackets, which then serve as a support for vertical runs. Cable trays are then bolted to bracket angles with support angle clips. Bracket angles have a series of slots to allow the attachment of various types of tray of the same width to the same bracket angle. Fabricated from hot dip galvanized steel.

| Tray Width | A | B | HDGAF |
|--|----|--------|--------|
| Single Z-Bracket | | | |
| 30 inch | 44 | 41-1/2 | SRZ-30 |

MP Husky offers a variety of wall brackets to support trays and channels from any wall or vertical support. The design of the brackets takes into consideration whether the trays or channels will be supported singly or two in parallel, on horizontal or vertical runs, the distance from the wall, bend radii, etc.

The allowable load of each type of bracket is given below:

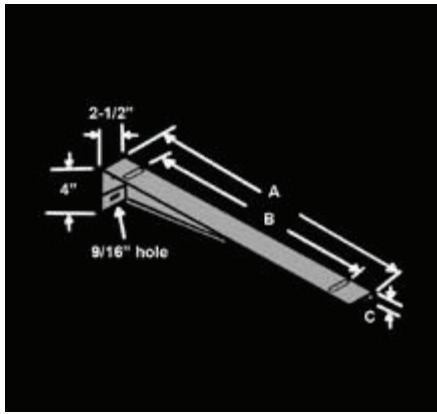

Condition 1

Condition 2

A minimum safety factor of 2 against yield has been used in determining the maximum allowable load. All calculations have been confirmed by testing. Brackets are most commonly used for single or double horizontal runs.

Low Headroom Brackets

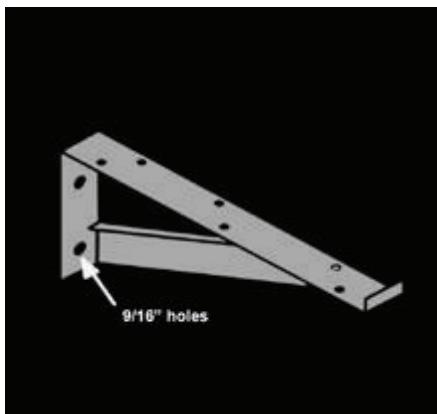

Low headroom brackets are designed to attach Husky Trough and Husky Flange-In Ladder to wall mounted strut type channel framing. Available in HDGAF.

Maximum allowable load:

Condition 1—500 lbs.

Condition 2—250 lbs.

| A | B | C | HDGAF |
|----|----|---------|--------|
| 25 | 21 | 1 | VBK-24 |
| 19 | 15 | 1-3/4 | VBK-18 |

| 10 | 6 | 2-13/16 | VBK-9 |
| 7 | 3 | 3-3/16 | VBK-6 |

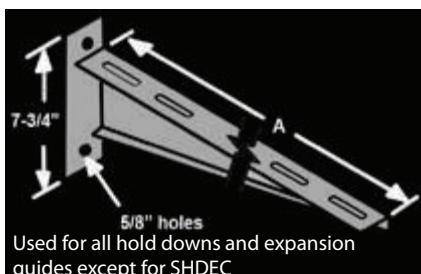

Channel Brackets

Channel brackets will accommodate single or double channel runs with pre-drilled holes for HB-10 Hold Down Bolts or SGB-GU expansion guides, purchased separately.

Maximum allowable load:

Twice the allowable load for the respective channel at a support spacing of 10 feet.

| Item | HDGAF | SS 304 | SS 316 |
|-----------------------|---------|----------|----------|
| Single for 4" Channel | SSBK-G | 4SSBK-G | 6SSBK-G |

| Double for 6" Channel | SDBK-G6 | 4SDBK-G6 | 6SDBK-G6 |

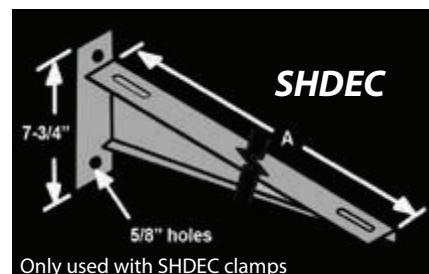

One Piece Universal Wall Bracket (NEW)

One piece, light duty brackets are made from 1/8" thick hot dip galvanized steel. Placing one bracket below another allows a minimum vertical spacing of cable trays of 8". Hold down clamps are not included.

Maximum allowable load:

Condition 1—600 lbs.
Condition 2—300 lbs.

Only used with SHDEC clamps

| Tray Width | "A" | Catalog No. |
|------------|---------|-------------|

| 18" | 26.625" | WBK-18-SHDEC |
| 12" | 20.625" | WBK-12-SHDEC |
| 9" | 17.625" | WBK-9-SHDEC |
| 6" | 14.625" | WBK-6-SHDEC |

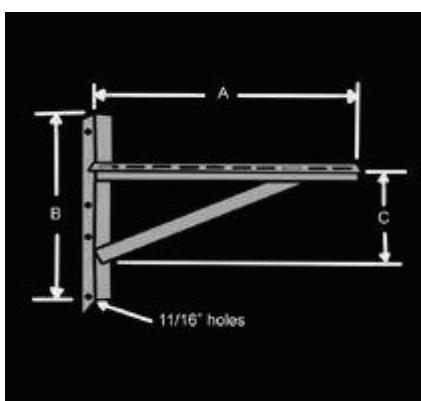

NOTE: SHDEC Clamps are only recommended for use with Flange-Out tray

Medium Weight Brackets

Medium weight brackets are used primarily to support 2 ladders side by side or 2 ladders one over the other. They are made of 3/16" structural angle, welded and hot dip galvanized. The horizontal support angle is continuously slotted to increase the versatility of the bracket. Mounting holes are 9/16" x 1-1/2" and are spaced 2" on center.

Maximum allowable load:

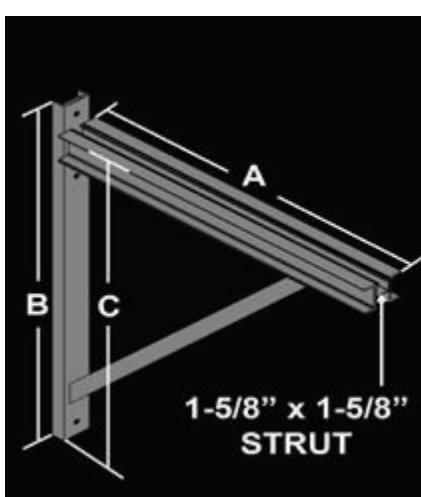

Condition 1: 1200 lbs.
Condition 2: 600 lbs.

| Type | A | B | C | Catalog No. |
|------|----|--------|--------|-------------|
| 49" | 49 | 31-1/2 | 25-1/2 | WBK-49M |
| 39" | 39 | 26 | 20 | WBK-39M |
| 30" | 31 | 21 | 15 | WBK-30M |
| 21" | 21 | 18 | 12 | WBK-21M |

Heavy Weight Brackets

Heavy weight, channel type brackets are used to support long spans or multiple ladder or trough installations that exceed the load capacity of ordinary brackets. They are welded from 3" structural steel channel with 1-1/2" channel stiffening members and 1-5/8" x 1-5/8" strut and hot dip galvanized. To develop the full strength of the bracket, the (3) 1 1/2" diameter bolts for which the wall members are drilled must be used. Tray is attached to the bracket using spring nuts and hold down clips.

Maximum allowable load:

4,000 lbs. when applied as 2 equally concentrated loads, spaced at least 2'-4" apart on brackets five feet wide and under; or at least 4'-6" apart on brackets over five feet

| Type | A | B | C | Catalog No. |
|------|----|----|----|-------------|
| 66" | 66 | 63 | 56 | WBK-66C |

| 42" | 42 | 39 | 32 | WBK-42C |
| 36" | 36 | 39 | 32 | WBK-36C |

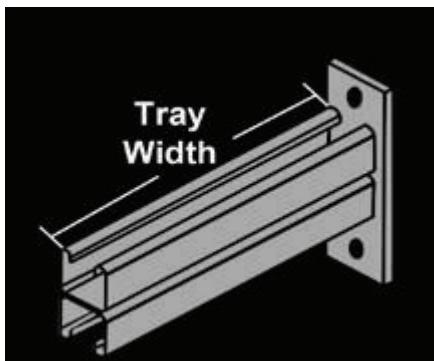

Single Strut Brackets

Designed primarily for use with strut framing, these brackets will work well in other applications. The uniform loads shown represent a 2.5 safety factor. Furnished in HDGAF steel.

Allowable concentrated end load:

One half the listed uniform load.

| Tray Width | Uniform Load | Flange-In Flange-Out | Flange Out |
|------------|--------------|----------------------|------------|
| 24" | 200lbs. | HP-S250-30 | HP-S250-30 |
| 18" | 500lbs. | HP-S250-24 | HP-S250-24 |
| 12" | 700lbs. | HP-S250-15 | HP-S250-18 |

| 18" | 1000lbs. | HP-S251-24 | HP-S251-24 |

Strut Type Support Channel

HP-type channels provide indirect support for hanger rods by spanning between available structural support beams and channels. The channel is supplied in 10' or 20' lengths and can easily be field cut to the length needed for use as a trapeze-type support. Available in single or double (back to back) configurations.

Covers

Cover Numbering System

MP Husky offers a wide variety of covers to provide protection for the cables contained within the system from sunlight, environmental elements, dirt, debris, and falling objects. All of the covers listed here are used for indoor as well as outdoor applications. Covers are fabricated from corrosion resistant aluminum, mill-galvanized steel, galvannealed and 304 or 316 stainless steel. Although not recommended, covers can be supplied in HDGAF steel on request (some distortion may occur when dipping). Most covers are supplied in standard 12 foot lengths and are available in five or six foot lengths upon request. HDGAF covers are supplied in five or six foot lengths, and 18GA material is required.

CAGF Aluminum Channel Cover
CSGF2 Steel Channel Cover

Types of Covers

Flat and Flat Flanged

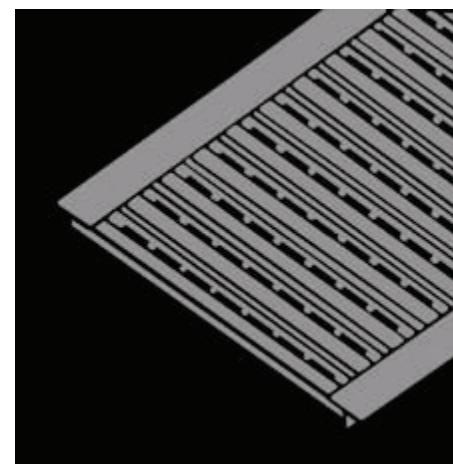

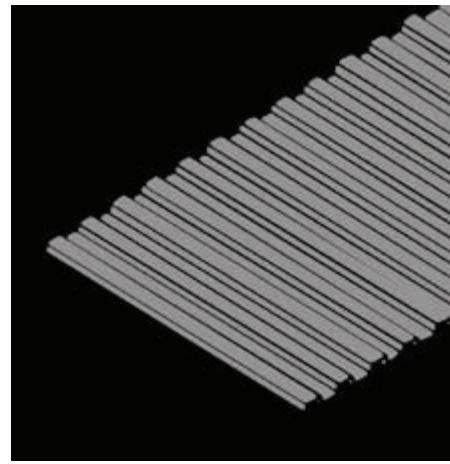

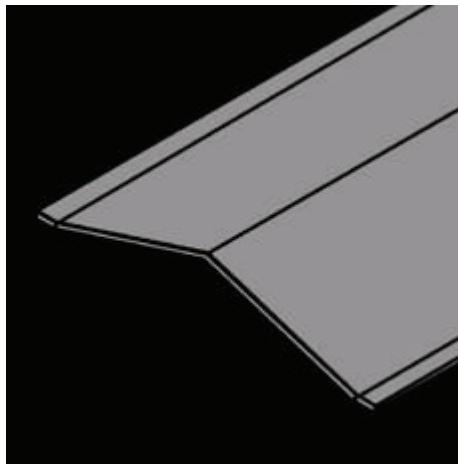

Flat covers are economical and available for all straight sections and fittings. These covers are available flat without flanges or flat with 3/8" flanges for Husky Trough, Husky Ladder, and Husky Way. Flat flanged covers should be used on all 4" and 6" wide channel applications requiring covers. Flat flanged shown.

Hat-Shaped

Hat-shaped covers are designed to protect installations where the cables extend above the upper flanges of the tray. Hat-shaped covers are available with a flat solid top or a corrugated ventilated top and in 2" or 4" height. Non-ventilated shown.

Louvered

Louvered covers are available for all straight sections and are available as Flat, Flat Flanged, or Hat Shaped. Flat Solid shown. (Fitting covers will be non-ventilated)

Peaked

Peaked covers are available for straight sections only and are generally used to deflect falling objects or to prevent the accumulation of snow or other debris. Standard peak height is 1/2", however, higher peaks are available upon request. Non-flanged shown.

Corrugated

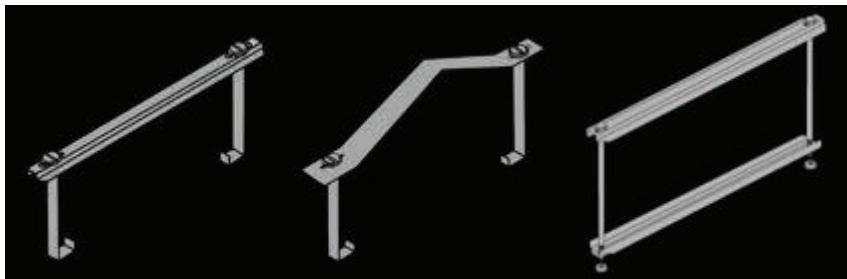

Corrugated covers are made of ventilated or non-ventilated corrugated sheets. Corrugated covers are rigid, lightweight and will readily form to vertical fittings, with the exception of Husky Ladder Flange-Out style. All covers for horizontal fittings are made of non-ventilated (solid) flat sheets without a flange.

Ventilated

Space does not permit an illustration of every type of cover variation. For instance, corrugated covers are available either ventilated or non-ventilated in flat or hat-shaped configurations. If in doubt about the cover best suited to your application, please consult the factory.

Cover Fasteners

A complete line of fastening devices is available for both indoor and outdoor applications. Local conditions will dictate the selection of the proper fastening device. Cover fasteners must be ordered separately for the application and spacing desired. Clips can be used indoors, but clamps or screws should be used outdoors. The following quantities can be used for most conditions:

Hold Down Clamps for Husky Ladder and Husky Trough

These heavy duty cover fasteners are used for covers installed in high wind areas. They are furnished with necessary hardware. Clamps are not recommended for hat-shaped covers.

Preferred for outdoor use.

Bar Clamp Style:

- 3 per 10' or 12' straight cover
- 2 min. per horizontal or vertical 90° fitting
- 3 per Tee fitting
- 4 per Cross fitting

For all covers, insert the following material prefixes for the type of material you would like to order:

HC =Mill Galvanized (shown)

AHC=Aluminum

6HC=Stainless Steel 316

4HC=Stainless Steel 304

GHC=HDGAF

Example:

For 24" wide, HDGAF, "HA" type tray, the cover clamp part number would be:

GHC-24-HA

| Husky Way & Channel | Double Bar Covers |
|---------------------|-------------------|
| 3-3/8" Husky Way | 2(HC)-()-H |
| 4" Husky Way | 2(HC)-()-J |
| 6" Husky Way | 2(HC)-()-M |
| G4/G6 Channel | 2(HC)-()-AG |
| G4/G6 Channel | 2(HC)-()-SG |

Cover Fasteners

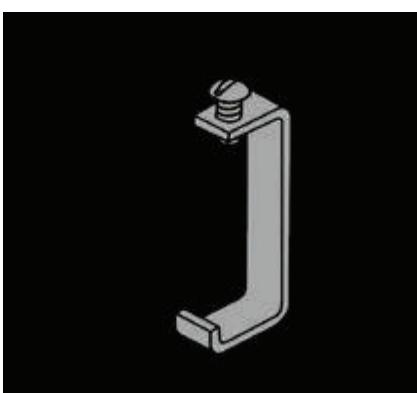

Cover Clips for Flange-Out Husky Ladder & I-Beam

This cover clip is designed to fasten the Electray covers (flange-out) shown in this section. Each clip is mill-galvanized steel and furnished with a thumb screw to facilitate inverted installation on flanged covers.

Clip Style:

- 8 per 12' of straight cover
- 4 min. per horizontal or vertical 90° fitting
- 6 per Tee fitting
- 8 per Cross fitting

| Top Flange | Plated | Steel |
|--------------------------------|--------|---------|

| All I-Beam (except I6 & I8) | ECC-IA | 6ECC-IA |
| All Others | ECC-E | 6ECC-E |

Cover Clips for Flange-In Husky Ladder and Husky Trough

These clips fasten the Husky Trough and Husky Flange-In Ladder covers shown in this section to Husky Trough and Husky Flange-In Ladder.

NOTE: Not for use with Husky Way or any brake formed pan

Banding, Banding Clips and Banding Tools

All covers, except peaked & hat-shaped may be secured with banding. Stainless steel banding is available with banding clips. Banding is 0.02" x 1/2" wide type 302 Stainless Steel strip. Clips are used to secure banding. Only a piece of wood and a pair of pliers are required to tighten and fasten in place, although a special banding tool is available for this purpose. The banding tool is used when a considerable amount of banding is to be done or when uniform tensioning of the banding is desirable. This tool has a built-in cut-off and extremely short (6") handles with aluminum knobs for use in tight quarters. The 36-tooth ratchet creates high tensioning power.

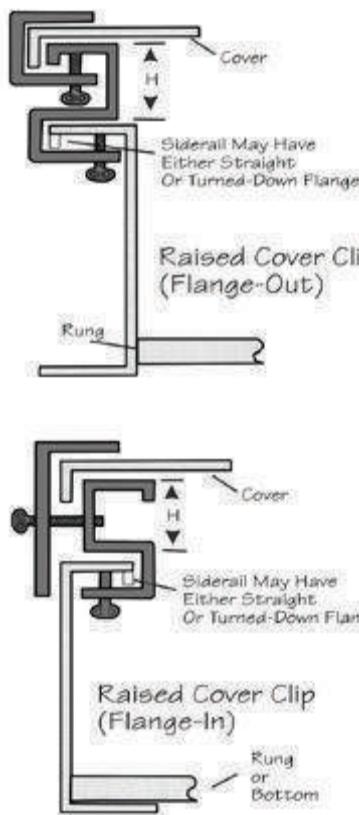

*Banding clips are each.

| Description | Catalog Number |
|-----------------------------|----------------|
| 100' Roll 1/2" Wide Banding | SCCB-100 |
| Banding Clips 1/2" Wide | SCCB-C |
| Banding Tool | CCB-T |

Cover Fasteners

Stand-Off Clips

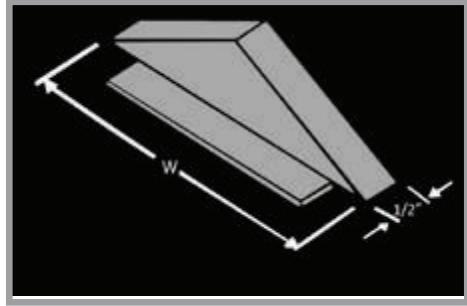

Cover stand-off clips provide a means to mount the cover above the tray side rail, allowing side ventilation. Cover stand-off clips should only be used with flanged covers and are available in various heights, offering a choice in the amount of open area for side ventilation. (Part # is for 1ea.)

() = Distance between tray flange & bottom of cover

NOTE: Not recommended for outdoor use with high wind speeds

Peak Cover End Cap

Used to close the end of a peaked cover where it ends against a flat cover.

Catalog

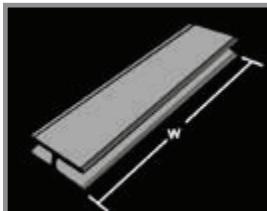

C(peak height)P-(material type*)(tray type*)(width)-EC

(Optional: add "-(degree of slope)" to the end of part number for a specific degree of peak slope)

Example:

C2P-A1-24-EC

*Refer to page 165 for material and tray types

Cover Joint Strips

These are used to join covers for all tray types.

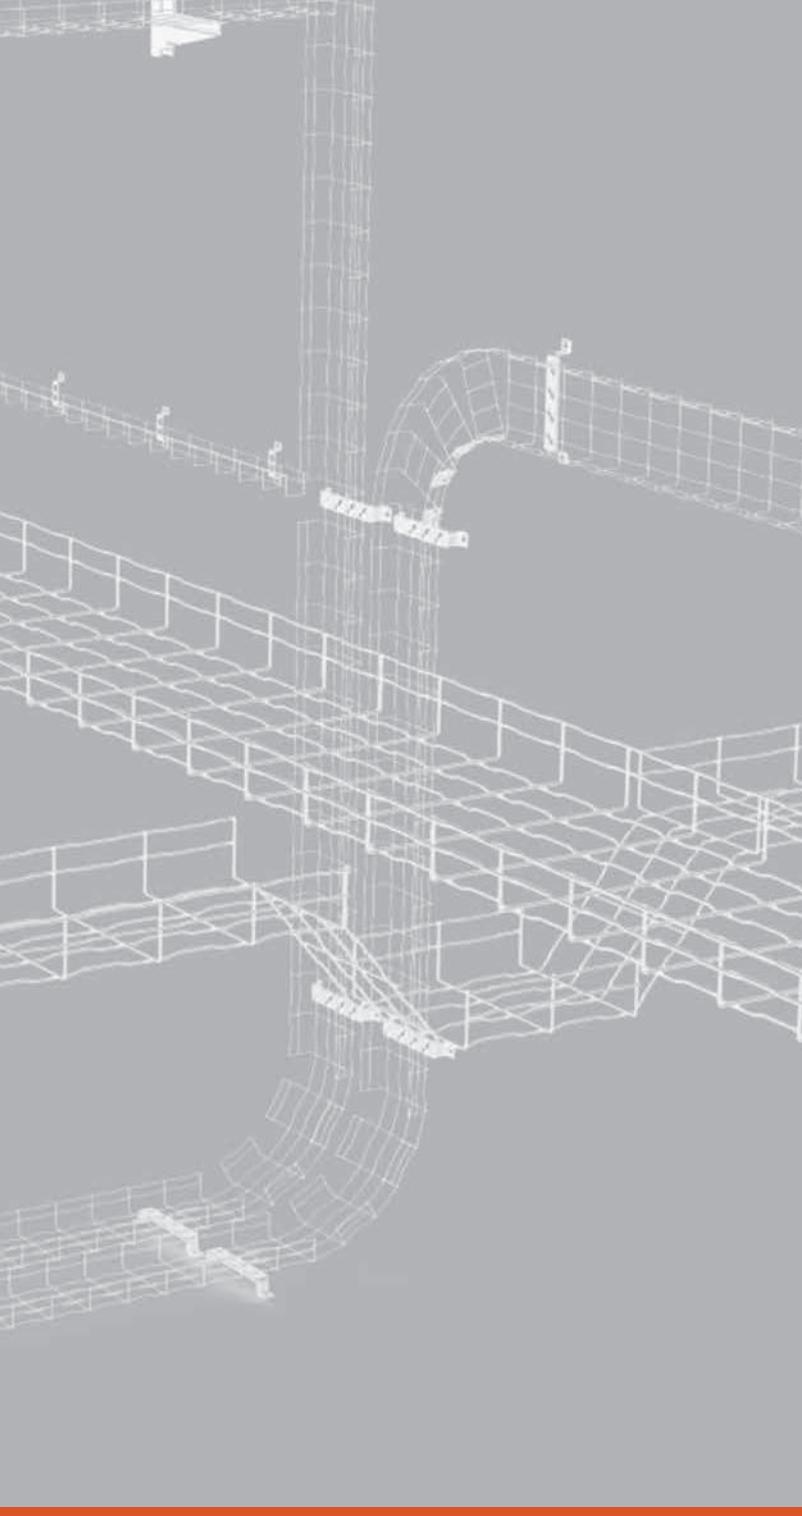

Cover Fastening Screws

All covers may be secured with self-drilling tapping sheet metal screws (B-26 shown).

Wire Basket Cable Trays

Electroplated Zinc

Wire Basket

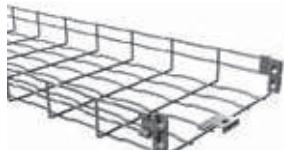

PATENT
9602521

- 1 Shipped with pre-attached splice plates, the BF2R Series offers a distinct advantage for installers. This system is designed for tool-less, quick installation.
- 2 The BF2R Series is UL Classified for use as an equipment ground conductor. No additional splice plates or bonding jumpers are required with pre-attached splice plates.
- 3 To avoid damage to cables or personnel, all MP Husky Wire Basket Cable Tray is manufactured with a safety edge.

LATERAL UNION SET

| Description | EZ Part No. | Self Weight (lbs/ud) | HDGAF Part No. | Self Weight (lbs/ud) |
|-------------------|------------------|----------------------|-------------------|----------------------|
| Lateral Union Set | LATERAL-UNION-EZ | 0.132 | LATERAL-UNION-HDG | 0.132 |

- 1.) The Lateral Union Set consists of a Lateral Union and a BF Bolt-Nut Set.
 2.) The Lateral Union Set is the recommended splice plate for BFR Series Wire Basket.
 3.) Lateral Union Sets are shipped in quantities of 100.

9602521

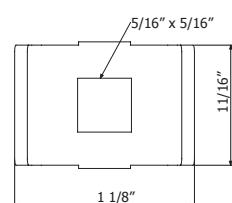

BF STAPLE

| Description | EZ Part No. | Self Weight (lbs/ud) | HDGAF Part No. | Self Weight (lbs/ud) |
|-------------|--------------|----------------------|----------------|----------------------|
| BF Staple | BF-STAPLE-EZ | 0.022 | BF-STAPLE-HDG | 0.022 |

- 1.) Combined with B1-EZ to mount PS-2, PS-4, and PS-6 separators.
2.) Shipped in quantities of 100.

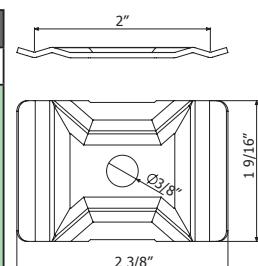

SSC HOLD DOWN

| Description | EZ Part No. | Self Weight (lbs/ud) | HDGAF Part No. | Self Weight (lbs/ud) |
|---------------|-------------|----------------------|----------------|----------------------|
| SSC Hold Down | SSC-EZ | 0.066 | SSC-HDG | 0.066 |

- 1.) Combined with one Bolt-Nut Set, two SSC Hold Downs can be used to created a adjustable horizontal fitting or small radius fitting.
2.) Combined with threaded rod and nuts, two SSC Hold Downs can be used as a center hanger support for 4", 6", and 8" widths.
3.) Combined with a spring nut and bolt, SSC Hold Downs can be used to secure wire basket to strut.
4.) Shipped in quantities of 50.

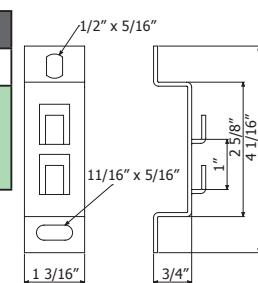

SIMPLE SL

| Description | PG Part No. | Self Weight (lbs/ud) | HDGAF Part No. | Self Weight (lbs/ud) |
|-------------|--------------|----------------------|----------------|----------------------|
| Simple SL | SIMPLE-SL-PG | 0.11 | SIMPLE-SL-HDG | 0.11 |

- 1.) Can be used to mount BF2R/BFR-04X2 and BF2R/BFR-02X2 to wall.
2.) 2 Simple SL's can be used as side hanger supports for wire basket for 2", 4", 6" and 8" widths.
3.) Shipped in quantities of 20.

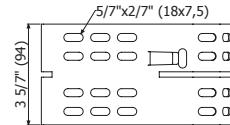

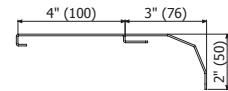

DROP-OUT PLATE

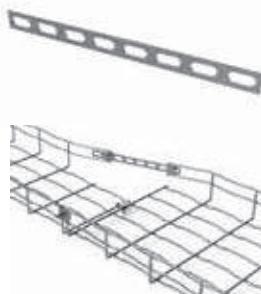

| Description | PG Part No. | Self Weight (lbs/ud) | HDGAF Part No. | Self Weight (lbs/ud) |
|----------------|-------------|----------------------|----------------|----------------------|
| Drop-Out Plate | DROP-OUT-PG | 0.4 | DROP-OUT-HDG | 0.4 |

- 1.) No hardware is required to secure Drop-Out Plate to wire basket.
 2.) Drop-Out Plate is not compatible with 2" and 4" wide wire basket.

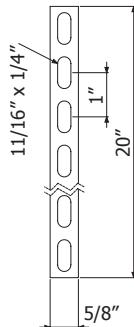

MULTI-UNION JOINT

| Description | PG Part No. | Self Weight (lb/ud) | HDGAF Part No. | Self Weight (lb/ud) |
|-------------------|----------------|---------------------|-----------------|---------------------|
| Multi Union Joint | MULTI-UNION-PG | 0.11 | MULTI-UNION-HDG | 0.11 |

- 1.) Multi purpose bracket used to field fabricate fittings.
 2.) Secured to wire basket using Bolt-Staple Sets
 3.) Shipped in quantities of 10.

HOLD DOWN CLIP

| Description | PG Part No. |
|----------------|-------------|
| Hold Down Clip | CLIP-FIL-PG |

- 1.) A quick and inexpensive option for securing wire basket to strut.
 2.) Shipped in quantities of 100

ZINC RICH PAINT

| Description | Part No. |
|-----------------|----------|
| Zinc Rich Paint | ZRP-740 |

- 1.) For optimum protection against corrosion, field cut ends should be coated with zinc rich paint.

CUTTING TOOL

| Description | Part No. |
|--------------|----------|
| Cutting Tool | WBCT |

- 1.) Used for cutting wires for field modifications.
 2.) This cutter is equipped with offset blades for more precise cutting.
 3.) Handles are 17" long.

| H4" Solid Bottom Inserts, 24" Wide | SB20SBI-24-3M | 26.02 | ZSB20SBI-24-3M | 26.59 |

1.) Solid Bottom Inserts are secured to wire basket using 1 SSC-EZ and 1 B1-EZ at each hole location (2 holes).

VERTICAL SPLICING PLATES

| Description | PG Part No. | Self Weight (lbs/ud) |
|------------------------|-------------|----------------------|
| Vertical Splice Plates | JUA-BFR-PG | 0.24 |

1.) Two splice plates required to create vertical fitting.
 2.) JUA-BFR includes the following hardware:
 a.) 2- B1-EZ
 3.) Secured to wire basket using Bolt-Staple Sets.

WALL SUPPORT

| Description | PG Part No. | Self Weight (lbs/ud) |
|--------------|-----------------|----------------------|
| Wall Support | WALL-SUPPORT-PG | 0.53 |

1.) Attached to wire basket using two Bolt-Staple Sets..

ADJUSTABLE SPLICES

| Description | PG Part No. | Self Weight (lbs/ud) |
|--------------------|-------------|----------------------|
| Adjustable Splices | CU-BFR-PG | 0.07 |

1.) Used for field fabrication of fittings. Splices are adjustable to allow for more flexibility.
2.) Shipped in quantities of 100.

SIDE HANGER CLIP

| Description | PG Part No. | Self Weight (lbs/ud) |
|------------------|-------------|----------------------|
| Side Hanger Clip | SU-T-PG | 0.07 |

1.) Acceptable for use on wire basket up to 8" width.
2.) Shipped in quantities of 25.

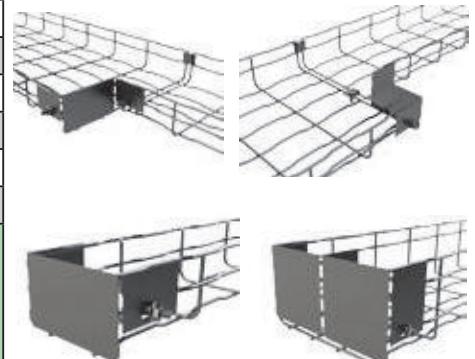

END PLATES/REDUCERS

| Description | PG Part No. | Self Weight (lbs/ud) |
|------------------|-------------|----------------------|
| 2" Deep, 2" Wide | REER-2X2-PG | 0.09 |
| 2" Deep, 4" Wide | REER-4X2-PG | 0.13 |
| 4" Deep, 2" Wide | REER-2X4-PG | 0.15 |
| 4" Deep, 4" Wide | REER-4X4-PG | 0.22 |
| 6" Deep, 2" Wide | REER-2X6-PG | 0.22 |
| 6" Deep, 4" Wide | REER-4X6-PG | 0.29 |

1.) REERs can be used as end plates or as reducers.
2.) 2 Bolt-Staple Sets are required to attach reducer/end plate to wire basket.
3.) REERs can be combined to create a larger width. If REERs are combined, a B1-EZ is required to attach REERs together.
4.) Shipped in quantities of 10.

2"X 2" SUPPORT

| Description | SS304 Part No. |
|---------------|----------------|
| 2"X2" Support | PS-2X2-4S |

1.) Used with 2" deep, 2" wide wire basket to allow for attachment of supports.

| 24" Raised Floor Support | 24" | 396 | SV-24-PG | 1.3 | SV-24-HDG | 1.41 |

1.) Used to raise wire basket 1 1/2" off of floor.
 2.) Can be used to secure wire basket to wall for vertical applications.
 3.) Two Bolt-Staple Sets are required to secure wire basket to support for 6" and 12" supports, and 4 Bolt-Staple Sets are required for 20" and 24" supports.
 4.) Raised Floor Supports are shipped in quantities of 5.

4" RAISED FLOOR SUPPORTS

| Description | PG Part No. |
|-------------------------|----------------|
| 4" Raised Floor Support | SFS-SUPPORT-PG |

1.) When combined with a Underfloor Bracket, creates a raised floor wire basket system.
 2.) Underfloor Bracket is secured to Raised Floor Support using 2 B1-EZ bolts.

Supports and Grounding

Wire Basket

2" RAISED FLOOR SUPPORTS

| Description | PG Part No. |
|---|-------------|
| 2" Raised Floor Supports | PBFR-2-PG |
| 1.) Used to raise wire basket 2" off floor. | |
| 2.) No hold down hardware required. | |

RAISED FLOOR BRACKET

| Description | PG Part No. |
|---|-------------|
| Raised Floor Support Bracket | KIT-FS-PG |
| 1.) One Underfloor Support Brackets and two Raised Floor Brackets are required to support wire basket to two raised floor posts. Two B1-EZ bolts are required to secure Underfloor Support Brackets to the Raised Floor Brackets. | |
| 2.) Raised Floor Brackets are shipped in quantities of 1. | |

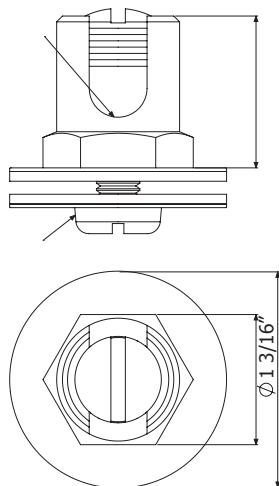

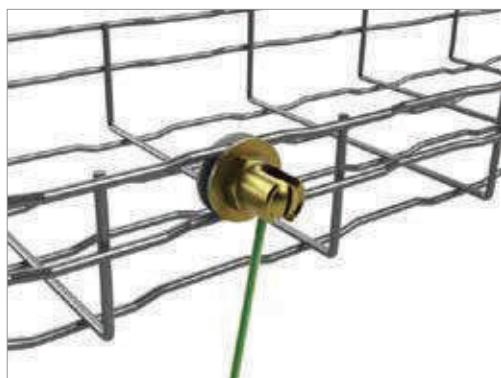

UNDERFLOOR SUPPORT BRACKET

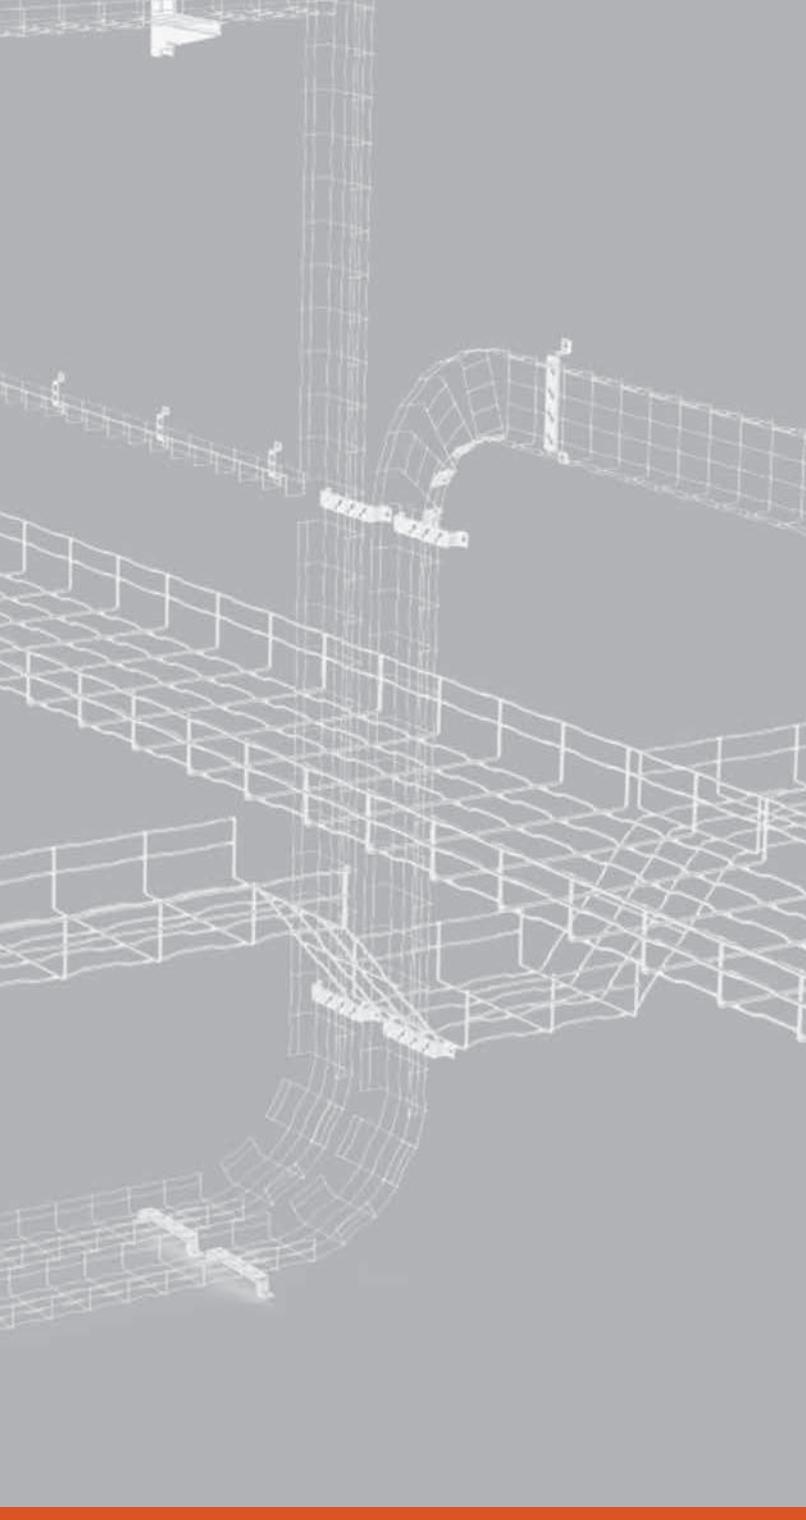

| Description | Width (in) | SWL (lbs/ft) | PG Part No. | Self Weight (lbs/ft) |
|---|------------|--------------|-------------|----------------------|
| Underfloor Bracket | 20" | 354 | CSVO-UF-PG | 1.21 |
| 1.) No additional hold down hardware required. | | | | |
| 2.) Secured to 2 Underfloor Support Brackets to create under floor support. | | | | |
| 3.) Fabricated for use with the following tray widths: 4" wide to 20". | | | | |
| 4.) Shipped in quantities of 5. | | | | |

GROUNDING CONNECTORS

| Description | Brass Part No. | Self Weight (lbs/ud) |

SPECIFICATIONS

- 1.0 Specification for Husky Wire Mesh Cable Support System**
- 2.0** Manufacturer: MP Husky
- 3.0** BF2R Series, (2" and 4" Deep), Product Description: The BF2R Series Wire Basket Cable Tray is formed from high strength steel wire mesh. The mesh is fabricated using a 2"x4" pattern, with welds at all intersections. Wire size for each tray type is optimized for both quality and strength. The BF2R Series comes with pre-installed splice connectors that allow for easy installation without the use of tools.
 - 3.1 Material: Standard tray finish shall be electroplated zinc (EZ). Other finish options available are as follows: Powder Coated (PC*).
 - 3.2 Connectors: Wire Basket Cable Tray shall have pre-installed quick splice connectors (The BF2R Series is Classified by UL for use as an equipment grounding conductor).
 - 3.3 Straight sections shall be supplied in 10' (3m/118-1/8") lengths.
 - 3.4 Safety Edge: Wire Basket Cable Tray shall have a safety edge to prevent inadvertent damage to cables or installers.
- 4.0** BFR Series, (2", 4", and 6" deep), Product Description: BFR Series Wire Basket Cable Tray is formed from high strength steel wire mesh. The mesh is fabricated using a 2"x4" pattern, with welds at all intersections. Wire size for each tray type is optimized for quality and strength.
 - 4.1 Material: Standard tray finish shall be electroplated zinc (EZ). Other finish options available are as follows: Hot Dip Galvanized After Fabrication (HDGAF), Stainless Steel 304 (SS304), Stainless Steel 316 (SS316), and Powder Coated (PC*).
 - 4.2 Straight sections shall be supplied in 10' (3m/118-1/8") lengths.
 - 4.3 Safety Edge: Wire Basket Cable Tray shall have a safety edge to prevent inadvertent damage to cables or installers.
- 5.0** Tray shall be UL Classified for use as an equipment ground conductor, when installed according to manufacturer's instructions.
- 6.0** Fittings: Fittings shall be field fabricated from straight sections, based on the needs of the installer. MP Husky recommends that wire basket is cut using a cutting tool with offset blades (WBCT). MP Husky offers a variety of different options for creating fittings and field modifications.
- 7.0** The Wire Basket Cable Tray shall be supplied by a member of NEMA VE-1 and installed in accordance with NEMA VE-2 "Cable Tray Installation Guidelines".

STANDARD FINISHES

Electroplated Zinc (EZ)

Electroplating is the process of applying a zinc coating to a product by electrolysis after the product has been fabricated. Electroplating requires that current be applied through the product, thereby attracting the zinc to the product. The Electroplated Zinc process creates a smooth, shiny finish that is capable of providing corrosion protection.

Hot Dip Galvanized After Fabrication (HDGAF)

Hot Dip Galvanizing After Fabrication is the process of applying a zinc coating by dipping the product in a bath of molten zinc after the part has been fabricated. While the steel is in the bath of molten zinc, the iron in the steel metallurgically reacts with the molten zinc to form a tightly-bonded alloy coating that provides superior corrosion protection to steel. Hot Dip Galvanized coating thicknesses vary depending on the thickness of the base metal, immersion rate, temperature of the bath, immersion period, and withdrawal rate. If the steel is exposed to the elements due to mechanical damage, the surrounding zinc corrodes sacrificially, protecting the underlying steel from corrosive attack.

Stainless Steel (SS304)

Stainless Steel 304 is steel alloyed with chromium and other elements to increase the corrosion protection of the steel. The chromium naturally reacts with the oxygen in the air, creating a chromium oxide layer that is resistant to corrosion.

Stainless Steel (SS316)

Stainless Steel 316 is similar to Stainless Steel 304, but alloyed with molybdenum. The molybdenum creates an additional layer of corrosion protection.

Powder Coated (PC)

Powder Coating is a process that begins with a dry powder and ends with a smooth, cured coating. The powder is electrostatically charged creating a positive attraction that draws the powder to the metal product. Powder is applied to the part, ensuring all areas are coated as evenly and thoroughly as possible. In order to cure the powder on the product, the product is then placed in an oven to allow the powder to melt and flow into an even coating.

Technical Information

HUSKY CENTRAY—CENTER HUNG AND WALL MOUNT CABLE TRAYS

Material: The spine and the rungs are manufactured from 6063-T6 high strength aluminum. The spine is 3" high and 1-1/2" wide. The rungs is 1/2" wide and 1/2" high.

Construction: The spine is punched on top or bottom to accept the insertion of rungs. The rungs are inserted through the spine and fastened by a four point high pressure staking operation that secures the rung in two locations on each side of the spine. The staking operation holds the rungs in place preventing loose rungs. The ends of the rungs are then bent upward to the desired fill depth (3", 4" or 6"), measured from the cable support surface to the top of the rung. The rung tips are rounded to prevent sharp edges.

Accessories: Each tray is supplied with a splice/hanger connector that is used to fasten the tray sections together and can also be used to hang the tray from 1/2" diameter hanger rods. The splice/hanger connectors are rectangular in shape and fit inside the tray spine and are secured with 3/8" bolts and nuts that pass through the sides. We offer a complete line of accessories and connectors to aid in installation. Wall mount trays also include three 3/4" wall spacers to space the tray off the wall and aid installation on uneven surfaces.

Lengths: The trays are supplied in 10' or 12' lengths that allow 10' or 12' support spacing, when hanging tray with the supplied splice/hanger connector.

Widths: All widths are measured to the inside of the rungs, except for bottom rung mount 6", 9", and 12" wide trays. These widths include an additional 1-1/2" for the spine width.

(Example: a 6" wide bottom mount width is 7-1/2")

Note: Wall mount trays require mounting on the ends and in the middle of 10' or 12' sections to meet loading requirements.

Advantages of Husky Centray Support Systems

- ◆ Cable tray sections are securely joined by only two bolts or an EZ-Clip, which greatly reduces installation costs.
- ◆ Reduced cable installation headaches, as the cable tray is easily accessed from the side. Cable loading, inspection and retrofit is simplified.
- ◆ For lightweight reliability, Husky Centray systems are made from corrosion-resistant, high-strength aluminum.
- ◆ EZ-Clip speeds installation time and minimizes hardware.
- ◆ Over 50% less support hardware than standard cable trays.
- ◆ Standard cable tray fittings are no longer needed for elbows, tees and crosses.
- ◆ For safety and reliability, rungs are firmly attached by the four-point staking method.
- ◆ All rungs have smooth, chamfered ends.

Top and bottom rung center-supported cable tray and wall rack are CSA certified.
(LR 107538)

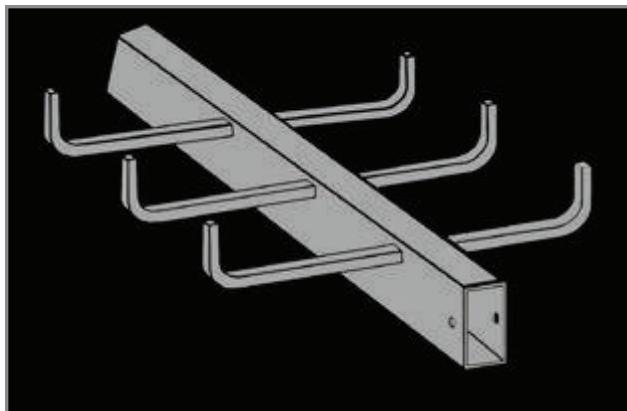

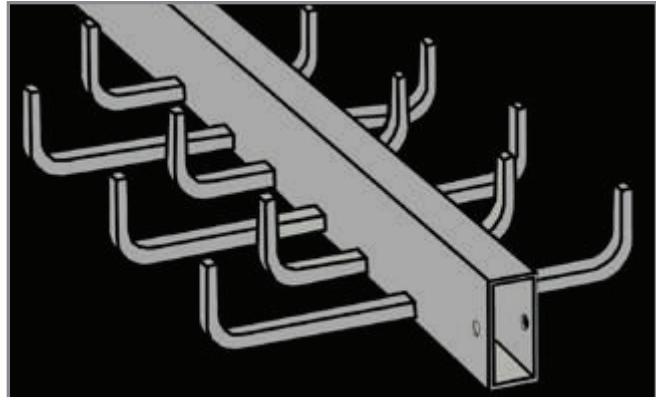

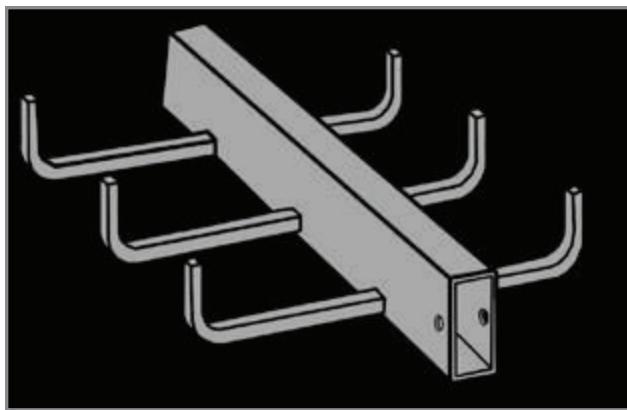

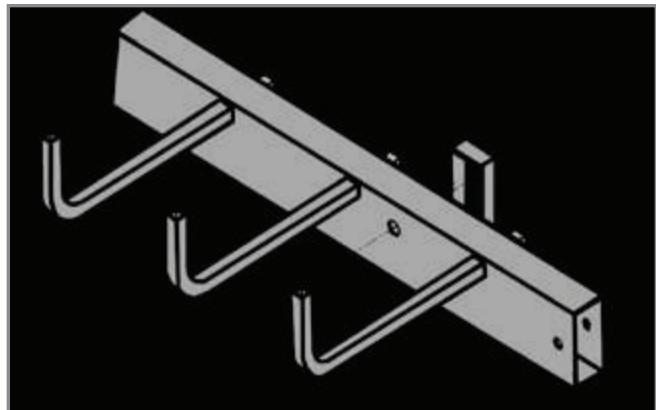

Top rung Husky Centray meets NEMA Load Class 12C and bottom rung Husky Centray meets NEMA Load Class 12B, in accordance with NEMA Standard VE-1.

Husky Centray systems are classified by Underwriters Laboratories as to their suitability for use as an equipment ground conductor.

15-CENTER RAIL

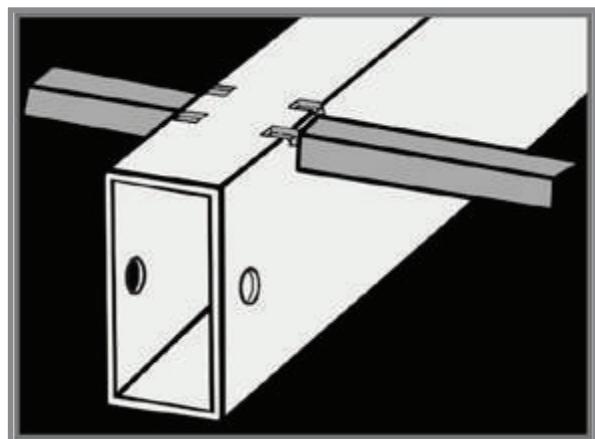

Top Rung**Dual-Width Rung****Bottom Rung****Wall Rack**

Safe, Secure Rung Attachment

Husky Centray rungs come attached transversely through either the top or bottom of the center tubular rail. Each rung is securely staked to the center rail in four places. This provides additional strength and rigidity for reliable cable support. The chances for damaging and loosening rungs during transportation and cable installation are significantly reduced with this safe, reliable and secure method of rung attachment.

Husky Centray rung tips are chamfered to provide a smooth end and limit possible damage to cables or personnel.

4-Point Staking

INTRODUCTION

For an integrated wire management system, Husky Centray simplifies the support and routing of power and telecom / teledata cabling. A single hanger rod is used at each support point. This makes installation easier by reducing support requirements and eliminating the need to pull cable through the trapeze supports. With Husky Centray, cables can be laid in on both sides.

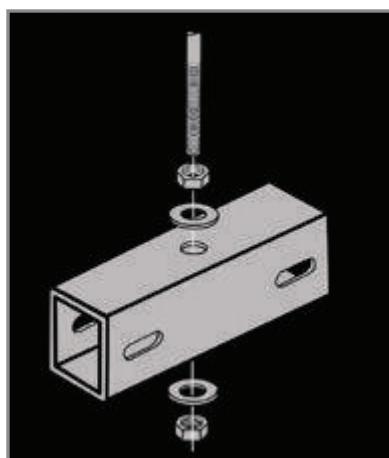

Easy Support and Coupling

Both the support and connection of Husky Centray sections is accomplished by a single splice coupling designed to save time. If additional support is needed beyond the 12 foot or 3 meter intervals, simply use the intermediate support hanger.

Note: Splice coupling and spine attachment hardware are included with each straight section.

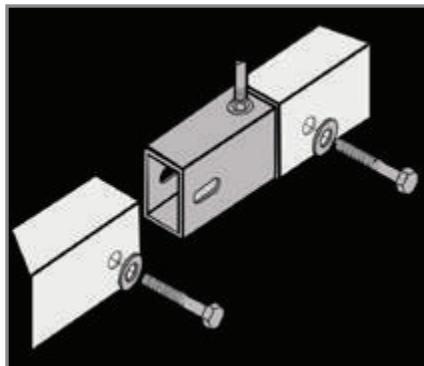

Step 1

Insert 1/2" rod into coupling

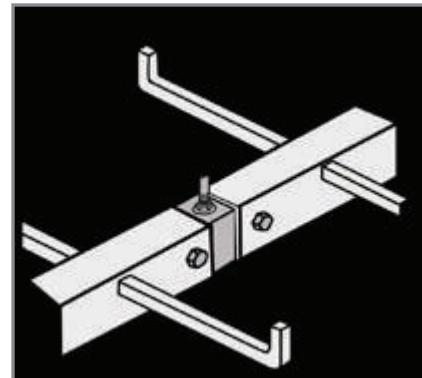

Step 2

Attach center section to coupling

Step 3

Slide together and tighten

Save time and money:

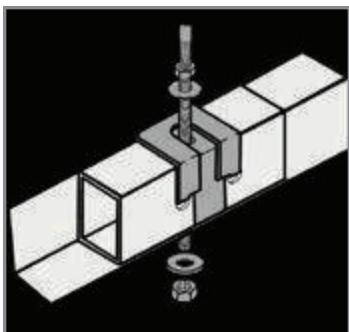

No elbow fittings required.

50% less labor.

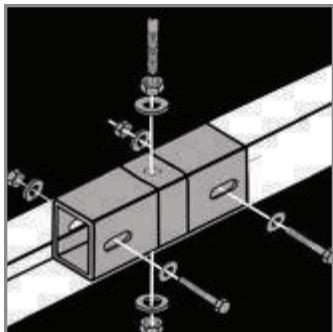

75% less components and hardware than traditional systems.

All rungs come firmly pre-attached.

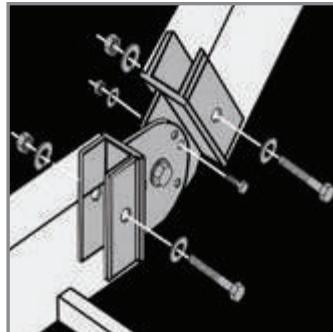

Reduce Fittings with Just Four Connectors Save Time with the EZ-Clip

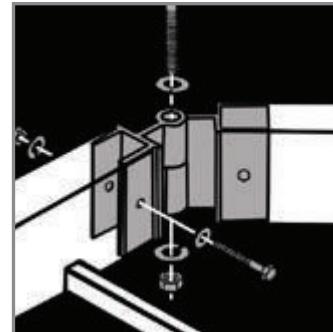

Straight Splice Connector
w/EZ-Clip

Straight Splice Connector
w/Bolts

Vertical Hinge
Connector

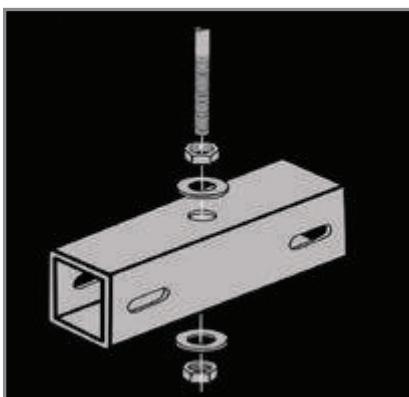

Horizontal Hinge
Connector

This exclusive new method allows for easy coupling of Husky Centray sections, without the nuts and bolts.

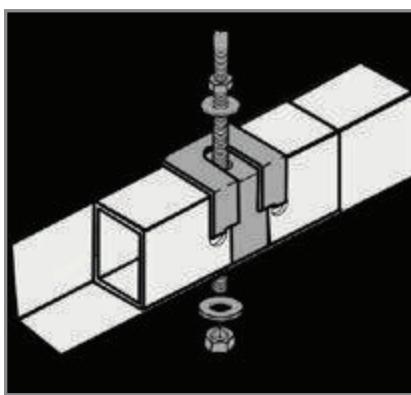

Step 1

Insert 1/2" rod into coupling

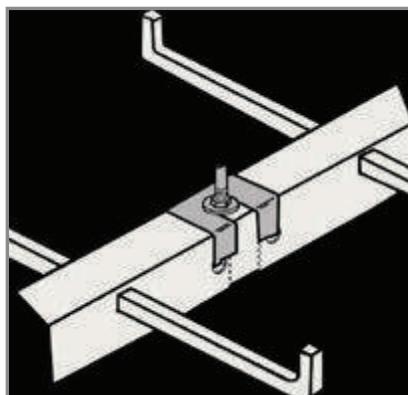

Step 2

Slide sections together and place EZ-Clip around threaded rod

Step 3

Clip in place & tighten

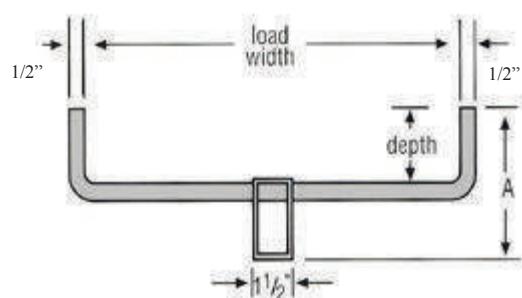

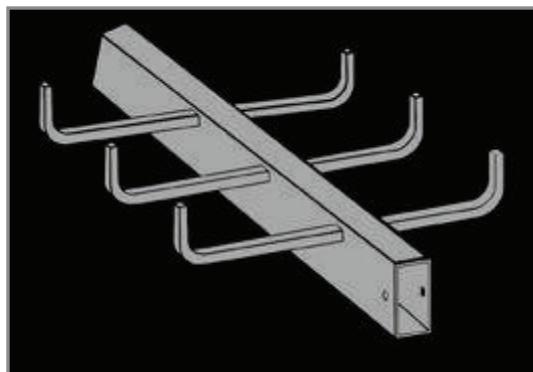

EZ-Clip can be used to attach to existing threaded rod due to its unique wrap-around design.

For more than 30 years, MP Husky's Fiberglass Cable Tray systems have been tested and proven in the harsh environment of the offshore oil and gas industry. Our tray has stood up to the test of being exposed to the corrosive conditions inherent in petroleum products, plus the daily punishment of exposure to wind, weather and salt water. MP Husky Fiberglass Cable Tray gives you the load capacity of steel, plus the inherent characteristics afforded by our Pultrusion Technology: non-conductive, non-magnetic and corrosion-resistant. Although light in weight, the strength to weight ratio surpasses that of equivalent steel products. Husky Fiberglass Cable Tray will not rust, nor does it ever require painting. It is available in both polyester and vinylester resin systems, manufactured to meet ASTM E-84, Class 1 Flame Rating and self-extinguishing requirements of ASTM D-635. Husky's Fiberglass Cable Tray comes in gray or blue (polyester resin) and beige (vinylester resin) but is available in custom colors upon request.

Load Data

Effect of Temperature

Strength properties of reinforced plastics are reduced when continuously exposed to elevated temperatures. Working loads shall be reduced based on the following:

| Temperature in Degrees F | Approximate Percent of Strength |
|--------------------------|---------------------------------|
| 75 | 100 |
| 100 | 90 |
| 125 | 78 |
| 150 | 68 |
| 175 | 60 |
| 200 | 52 |

NEMA FG-1 Latest Edition. If unusual temperature conditions exist, please consult the manufacturer.

Typical Properties of Pultruded Components

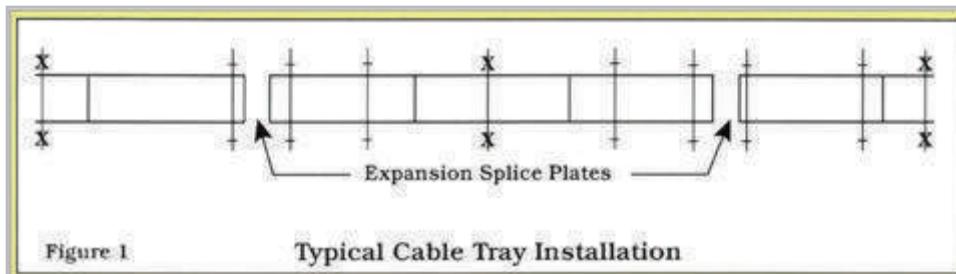

MP Husky's Fiberglass Cable Tray systems are manufactured from glass fiber-reinforced plastic shapes that meet ASTM E-84, Class 1 Flame Rating and self-extinguishing requirements of ASTM D-635. A surface veil is applied during pultrusion to insure a resin-rich surface and ultraviolet resistance.

Cable Tray Thermal Contraction and Expansion

It is important that thermal contraction and expansion be considered when installing cable tray systems. The length of the straight cable tray runs and the temperature differential govern the number of expansion splice plates required (see Table 1). The cable tray should be anchored at the support nearest to its midpoint between the expansion splice plates and secured by expansion guides at all other support locations (See Figure 1). The cable tray should be permitted longitudinal movement in both directions from that fixed point.

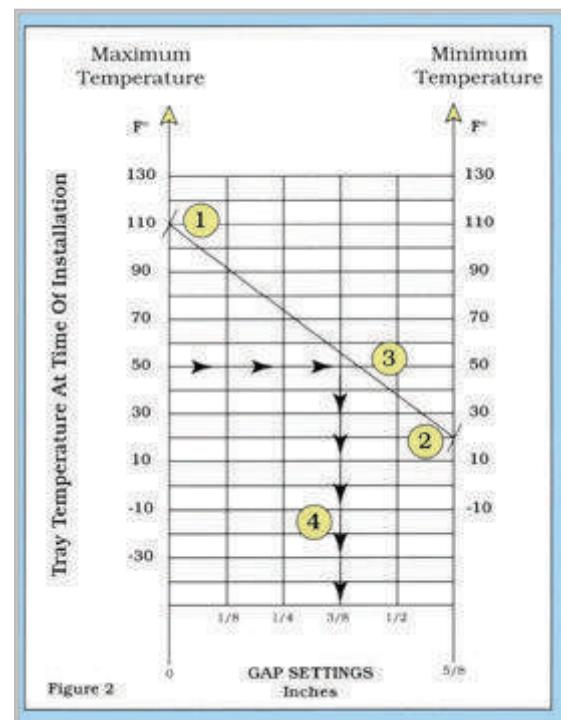

| Table 1 Expansion or Contraction for Various Temperature Differences | | |
|---|---------------------------------------|--|
| Temperature Differential °F | Cable Tray Length for 1" Expansion | Each Tray Length for Expansion Connector* |
| 25 | 667 Feet | 417 Feet |
| 50 | 333 Feet | 208 Feet |
| 75 | 222 Feet | 139 Feet |
| 100 | 167 Feet | 104 Feet |
| 125 | 133 Feet | 83 Feet |
| 150 | 111 Feet | 69 Feet |
| 175 | 95 Feet | 59 Feet |

Note for gap set and hold down/guide location, see installation instruction above.
*1" slotted holes in each expansion connector allow 5/8" total expansion or contraction.

Accurate gap setting at the time of installation is necessary for the proper operation of the expansion splice plates. The following procedure should assist the installer in determining the correct gap (see Figure 2):

1. Plot the highest expected tray temperature on the maximum temperature line
2. Plot the lowest expected tray temperature on the minimum temperature line
3. Draw a line between the maximum and minimum points
4. Plot the tray temperature at the time of installation to determine the gap setting

Cable Tray Installation Guide

Installation of MP Husky Fiberglass Cable Tray should be made in accordance with the standards set by NEMA Publication VE-2 latest edition and National Electrical Code, Article 392.

- ◆ Always observe common safety practices when assembling tray and fittings. Installations generally require some field cutting. Dust created during fabrication presents no serious health hazard, but skin irritation may be experienced by some workers.
- ◆ Operators of saws and drills should wear masks, long sleeve shirts, or coveralls.
- ◆ Fabrication with Husky Fiberglass is relatively easy and comparable to working with wood. Ordinary hand tools may be used in most cases.
- ◆ Avoid excessive pressure when sawing or drilling. Too much force can rapidly dull tools and also produce excessive heat which softens the bonding resin in the Husky Fiberglass, resulting in a ragged edge rather than a clean-cut edge.
- ◆ Field cutting is simple and can be accomplished with a circular power saw with an abrasive cut-off wheel (masonry type) or hack saw (24 to 32 teeth per inch).
- ◆ Drill Husky Fiberglass as you would drill hard wood. Standard twist drills are more than adequate.
- ◆ Any surface that has been drilled, cut, sanded or otherwise broken, **must be sealed** with a compatible resin.
- ◆ Carbide tipped saw blades and drill bits are recommended when cutting large quantities.
- ◆ Support the Husky Fiberglass material firmly during cutting operations to keep material from shifting, which may cause chipping at the cut edge.
- ◆ Each tray section length should be equal to or greater than the support span.
- ◆ When possible, the splice should be located within the quarter span.
- ◆ Fittings should be supported as per NEMA VE-2.

How to Order Husky Fiberglass Cable Tray:

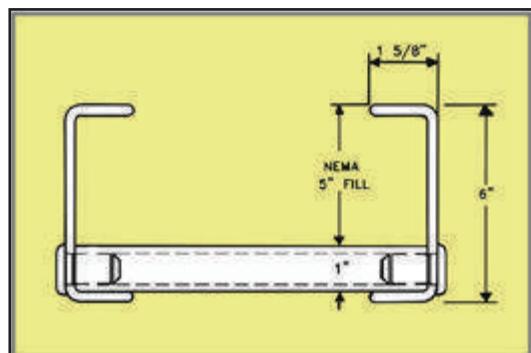

1. Select the correct MP Husky Series Cable Tray using the Load Data for straight sections shown in the appropriate tabbed section for 6", 4" and 3" Cable Tray. (**Example: 6BP-09-24-240 would be for NEMA 20B tray.**)
2. Select the resin required. Refer to the Corrosion Guide on pages 215-218 of the Technical Data Section for the effect of environmental conditions on the desired material. This section also contains the temperature range for our tray.
3. The tray prefix is completed by inserting the rung spacing.
4. The fourth box contains the straight section width in inches.
5. The fifth box contains the straight section length in inches.

Please note:

**One pair of splice plates with hardware is included.
Fittings are available in molded or mitered design.**

To obtain deflection at any span length for lighter loads than listed, multiply the load by the K factor. When trays are used in continuous spans, the deflection of the tray is reduced by as much as 50%.

Husky Series 6B / NEMA 20B

Safety Factor 1.5

CABLE TRAY

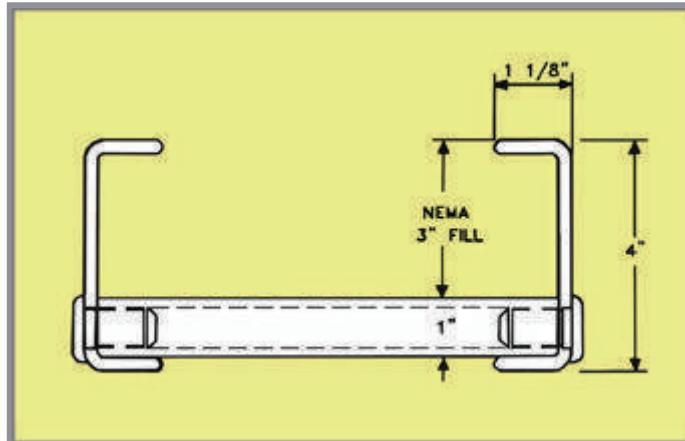

Series 4

4P-09-24-120

| 4 | P- | 09- | 24- | 120 |
|----------------------|---|--|--|--|
| Series | Material | Rung Spacing | Width | Length |
| Series: 4" | P=Polyester Resin V=Vinylester Resin | Rung Spacing: 06" 09" 12" 18" | Width: 06" 09" 12" 18" 24" 30" 36" | Length: 120 (10ft.) 240 (20ft.) |

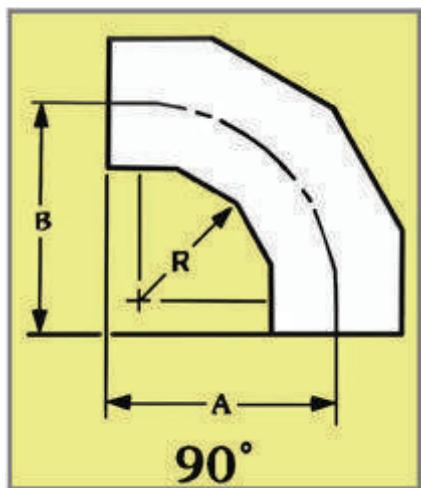

To obtain deflection at any span length for lighter loads than listed, multiply the load by the K factor. When trays are used in continuous spans, the deflection of the tray is reduced by as much as 50%.

| Husky Series 4 | Safety Factor 1.5 | | | | |
|----------------------|-------------------|-------|-------|-------|-------|
| Span (Ft.) | 10 | 12 | 14 | 16 | 18 |

To obtain deflection at any span length for lighter loads than listed, multiply the load by the K factor. When trays are used in continuous spans, the deflection of the tray is reduced by as much as 50%.

Part Number with Hardware Explanation—Part # XSS-0000*

*Indicates that additional information must be furnished to specify the type of hardware.

| Hardware Option | 316 Stainless Steel | Monel | Silicone Bronze | Husky Fiberglass |
|-----------------|---------------------|-------|-----------------|------------------|
| Replace * with | SS6 | MO | SB | FR |

Examples: XSS-4003—pair of 4 hole splice plates for 3" system without hardware

XSS-4004 SS6—pair of 4 hole splice plates for 4" system with stainless steel hardware

CSS-8006 SB—pair of 8 hole splice plates for 6" system with silicon bronze hardware

Recommended Fiberglass Cable Tray Specifications

1.0 Cable Tray Design

- 1.1 Cable Tray System shall be made of straight sections, fitting and accessories as defined in the latest NEMA standards publication FG-1.

2.0 Cable Tray Design

- 2.1 Straight section structural elements: side rails, rungs and splice plates shall be pultruded from glass fiber reinforced polyester or vinyl ester resin.
- 2.2 Pultruded shapes shall be constructed with a surface veil to ensure a resin-rich surface and ultraviolet resistance.
- 2.3 Pultruded shapes shall meet ASTM E-84, Class 1 flame rating and self-extinguishing requirements of ASTM D-635.

3.0 Construction

- 3.1 Straight section lengths will be 120 inches (10ft.) or 240 inches (20ft.) standard.
- 3.2 Side rails will be inward "C" configuration and be pre-drilled to accept splice plates.
- 3.3 Loading depths for cable tray systems shall be 5", 3", or 2" as per NEMA FG-1 tolerances. Overall heights shall be 6", 4", or 3" respectively.

4.0 Fittings

- 4.1 Molded fittings shall be formed with a minimum 3" tangent following the radius.
- 4.2 3" or 5" loading depth systems shall have 90° and 45° molded fittings in 12" or 24" radius.
- 4.3 All fittings not included in 4.2 should be of mitered construction.
- 4.4 Width—useable inside tray width shall be 6", 9", 12", 18", 24", 30", or 36". Outside width shall not exceed inside by more than a total of 2".
- 4.5 Straight and expansion splice plates will be of stainless steel or Husky Fiberglass design with an eight bolt pattern in 5" fill systems and four bolt pattern in 3" and 2" fill systems.
- 4.6 Dimension tolerances will be per NEMA FG-1.
- 4.7 Cable tray must have integral connection between side rails and rungs consisting of non-metallic mechanical fasteners and adhesive bonding.

5.0 Manufacture

- 5.1 All manufacturing practices will be in accordance with NEMA FG-1.

Accessories

Standard Splice Plates

Included in needed quantities with tray section:

- ◆ Order only pairs of splice plates needed for field fabrication.
- ◆ SS6 hardware supplied as standard—use SS6 suffix.
- ◆ Other hardware available, specify by hardware suffix. Hardware other than SS6 is considered special.

| Height | Catalog No. (Stainless) | Catalog No. (Polyester) | Catalog No. (Vinylester) |

NOTE: Hardware suffix is needed to complete the part number.

All splice plate hardware is 3/8"

Hardware suffixes:

SS6 = 316SS

SB = Silicon Bronze

MO = Monel

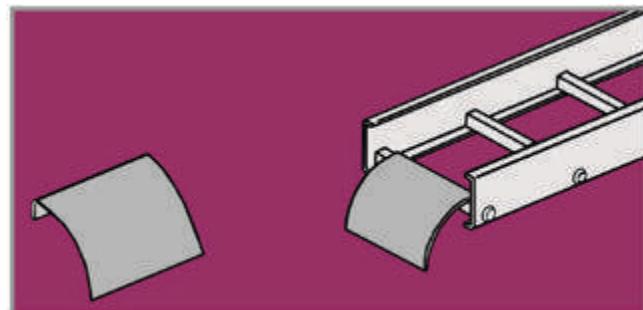

FR = Husky Fiberglass

Ladder Drop Out

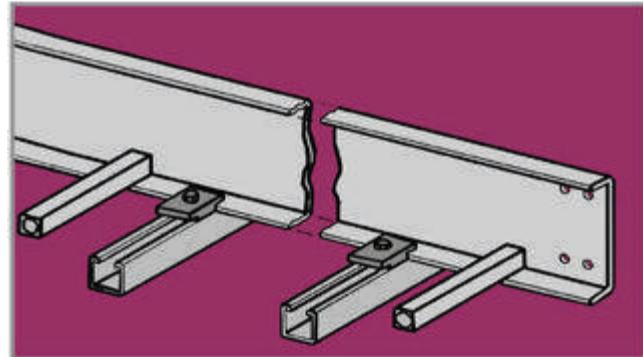

Specially designed Ladder Drop-Outs provide a rounded surface with adequate radius to protect cable as it exits from the tray, preventing damage to insulation. (4" radius)

Catalog #XDOP-1104-W

(W = width)

**Clamp/Guide—Husky Fiberglass**

Designed for use with 3/8" hardware (not included). Combination hold down clamp and guide. This item is sold in pairs.

Catalog #XFP-1208 (non-metallic)**Flexible Horizontal and Straight Barrier Kit**

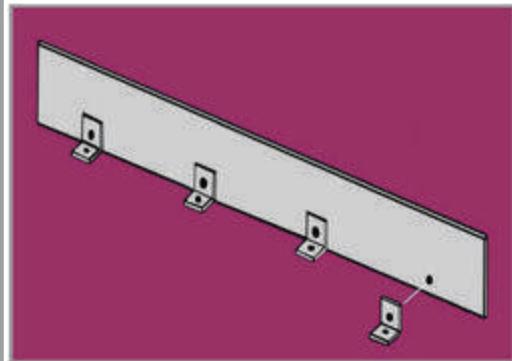

One flexible kit allows up to 38" radius position of the barrier. For larger than 38" radius, two kits are required.

| Side Rail Height | Loading Depth 'H' | Flexible Barrier Kit Number | Straight Barrier Number |
|------------------|-------------------|-----------------------------|-------------------------|
| 6" | 4-11/16" | BS06P-90HBFL | BS06P-120 |
| 4" | 2-11/16" | BS04P-90HBFL | BS04P-120 |
| 3" | 1-3/4" | BS03P-90HBFL | BS03P-120 |

For Vinylester—replace "P" with "V".

Kit Contents—1pc. Of 72" straight barrier, 4 barrier strip clips, 8 thermo plastic drive rivets, 4 stainless steel self drilling screws.

Assembly required—directions are included.

**Vertical Barriers**

Sample Catalog #BS06P-90VO-24

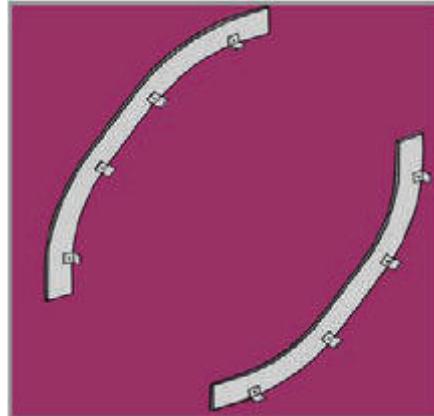

BS06 = Barrier Size

P = Polyester Material (use V for Vinylester)

90 = Angle

VO = Vertical Inside or Vertical Outside

24 = Radius

Resin Seal Kit and Spray Sealant

Brush-On Resin Seal Kit is used to reseal Husky Fiberglass after field modifications.

Catalog #8-2-SEAL (1 pint)

Catalog #8-2-Seal-QT (1 quart)

Contents: Resin, Catalyst, Stir Stick, and Applicator. All kits are Vinylester Resin.

Spray Sealant is also used to reseal Husky Fiberglass after field modifications.

Catalog #Clear-1215

12 fl. oz. spray acrylic

Drive Rivet

Shipped in packages of 25 pcs.

Catalog #TPDR (Thermo Plastic)

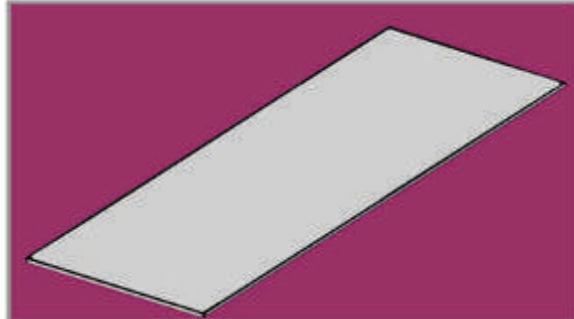

Catalog #S34PR (Stainless)

Cover

1/8" Thick, 120" Long

10 ea. #10 stainless, self-drilling screws are provided with each section.

| Catalog # | Description |
|-------------|-------------------|
| FC-P-W*-120 | Flat Polyester |
| FC-V-W*-120 | Flat Vinylester |
| PC-P-W*-120 | Peaked Polyester |
| PC-V-W*-120 | Peaked Vinylester |

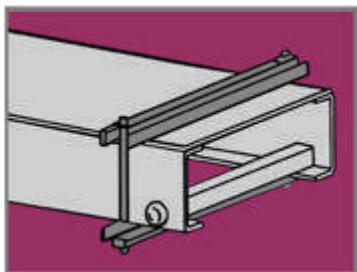

Peaked covers are for straight sections only.

*W** = insert width of tray.

Cover Clamps

Heavy Duty Cover Clamp

| Catalog # | Side Rail Height |
|---------------|------------------|
| XWC-P-W*-9064 | 6" |
| XWC-P-W*-9044 | 4" |
| XWC-P-W*-9034 | 3" |

For Vinylester, replace "P" with "V" in the catalog number on Cover and Cover Clamps.

*W** = tray width

Loading Information—Beam Loads: The charts below list the total allowable uniform load for various simple spans based on a minimum safety factor of 2. If the load is concentrated at the center span, multiply the load from the below charts by 0.5 and the corresponding deflection by 0.8. Note: All beams should be supported in a manner to prevent rotation at supports. Long, deep beams should be tied between supports to prevent twist.

Beam Loading Data for Glass Reinforced Polyester Resin

| | | Maximum Allow. Load | | Defl. @ Maximum Allow. Beam Load | | Allowable Load @ Deflection | | | |
|------------------|--------------------|---------------------|----------|----------------------------------|-----------|-----------------------------|----------|-------------|----------|

 MP **HUSKY**
CABLE TRAY & CABLE BUS

SPECIFICATIONS

1.0 Specification for Aluminum and Steel Ladder

2.0 General

- 2.1 Cable tray systems shall be of the design of one manufacturer and shall be designed so that there are no burrs, projections, or sharp edges to damage cable insulation.
- 2.2 Fittings shall have the same load carrying capacity as straight sections. Fittings shall be of the continuous arc type with a 12, 24, 36, or 48 inch radius, unless otherwise shown on the drawings.
- 2.3 Ladder type tray straight sections shall be 10'-0", 12'-0", 20'-0", 24'-0", or 30'-0" long and shall be of the width indicated on the drawings to provide the planned cable capacity.

3.0 Material and Construction

- 3.1 **Aluminum Ladder** type cable tray longitudinal members shall be 4-1/2", 6", 7", 8", or 10" deep extruded aluminum channels or I-Beams of 6063-T6 aluminum alloy.
Steel Ladder type cable tray shall be 3-3/8", 4", 4-1/2", 6", or 7" deep channels mill galvanized (ASTM A-653 G90), hot dip galvanized after fabrication steel (ASTM A-123), 304 stainless steel, or 316 stainless steel.
- 3.2 **Aluminum Ladder** transverse members (rungs) shall be of extruded aluminum alloy 6063-T6 and shall be designed to prevent collection pockets for moisture or contaminant materials.
Steel Ladder transverse members (rungs) shall be designed to prevent collection pockets for moisture or containment materials.
- 3.3 **Husky Ladder (Flange-Out)**—Transverse members (rungs) shall be inserted into a slot punched in the longitudinal members conforming to the contour of the transverse member and heliarc welded on the out side of the longitudinal member. Transverse members shall be located on 9", 12" and 18" spacing.
Flanges on straights and fittings shall point outward.
Husky Ladder (Flange-In)—Transverse members (rungs) shall be joined to the longitudinal members by means of a minimum of two resistance welds or two high strength clinches or heliarc welded at each end of the transverse member. Transverse members shall be located on 6", 9", and 12" spacing. Flanges on straights and fittings shall point inward.

4.0 Splice Joints

- 4.1 Resistance across any splice connection shall not exceed 330 microhms.
- 4.2 Splice connector design shall be universal for use on straight sections and fittings.
- 4.3 Splice connectors shall be of the high pressure bolted type with a minimum of four bolts per connector.

5.0 Loading

- 5.1 Husky Ladder type cable tray shall have a load safety factor of 1.5 based on the destruction load capacity as defined within NEMA Standard VE1.
- 5.2 The Husky Ladder type cable tray shall meet or exceed the following NEMA load classification:

| | |
|----------------------------------|----------------------------------|
| 8A (50lbs. per ft./8ft. Span) | 16A (50lbs. per ft./16ft. Span) |
| 8B (75lbs. per ft./8ft. Span) | 16B (75lbs. per ft./16ft. Span) |
| 8C (100lbs. per ft./8ft. Span) | 16C (100lbs. per ft./16ft. Span) |
| 12A (50lbs. per ft./12ft. Span) | 20A (50lbs. per ft./20ft. Span) |
| 12B (75lbs. per ft./12ft. Span) | 20B (75lbs. per ft./20ft. Span) |
| 12C (100lbs. per ft./12ft. Span) | 20C (100lbs. per ft./20ft. Span) |

6.0 UL

- 6.1 The cable tray system shall be classified for use as an equipment ground and requires that the minimum cross sectional area be shown on the tray labels. The industry standard is to mark each straight section and fitting with its own cross sectional area. It is the responsibility of the installer and or user to assure that the capacity of the overall system is adequate to meet the anticipated ground fault of the system.

7.0 Manufacture and Data

- 7.1 The following data shall be provided with the quotation:
(a) Simple beam load and deflection tables (b) Drawings illustrating tray quoted and splice connection
- 7.2 Tray shall be manufactured in accordance with and by a member of NEMA VE1.

1.0 Specification for Aluminum and Steel Trough

2.0 General

- 2.1 Cable tray systems shall be of the design of one manufacturer and shall be designed so that there are no burrs, projections, or sharp edges to damage cable insulation.
- 2.2 Fittings shall have the same load carrying capacity as straight sections. Fittings shall be of the continuous arc type with a 12, 24, 36, or 48 inch radius, unless otherwise shown on the drawings.
- 2.3 Husky Trough type tray straight sections shall be 10'-0", 12'-0", 20'-0", 24'-0", or 30'-0" long and shall be of the width indicated on the drawings to provide the planned cable capacity.

3.0 Material and Construction

- 3.1 **Aluminum Trough** type cable tray longitudinal members shall be 4-1/2", 6", 7", 8", or 10" deep extruded aluminum channels or I-Beams of 6063-T6 aluminum alloy.
- 3.2 **Steel Trough** type cable tray longitudinal members shall be 3-3/8", 4", 4-1/2", 6", or 7" and shall be steel mill galvanized (ASTM A-653 G90), or hot dip galvanized after fabrication steel (ASTM A-123).
- 3.3 **Aluminum Trough** bottom shall be of corrugated sheet type construction. Corrugation shall be approximately 3/8" deep on 1-1/2" pitch to provide a minimum cable support surface of 5.5" per linear foot of tray length. The corrugated bottom shall be attached to the bottom flange of the channel or I-Beam shaped longitudinal member by means of resistance welding or high strength clinches at a minimum of 3" intervals. Note: For ventilated trays over 24" wide, use ladder type construction (Ventrays) with 4" spacing.
- 3.4 **Husky Trough w/ Solid Bottom**—The solid bottom trough style tray shall be constructed of continuous solid corrugation. Flanges on straights and fittings shall point inward.
- 3.5 **Husky Trough w/ Ventilated Bottom**—The ventilated bottom trough style tray shall be constructed of continuous ventilated corrugation. The corrugation shall have a minimum of 40% open area to provide adequate ventilation for cables. For ventilated trays over 24" wide, use ladder type construction (Ventrays) with 4" rung spacing. Flanges on straights and fittings shall point inward.

4.0 Splice Joints

- 4.1 Resistance across any splice connection shall not exceed 330 microhms.
- 4.2 Splice connector design shall be universal for use on straight sections and fittings.
- 4.3 Splice connectors shall be of the high pressure bolted type with a minimum of four bolts per connector.

5.0 Loading

- 5.1 Husky Trough type cable tray shall have a load safety factor of 1.5 based on the destruction load capacity as defined within NEMA Standard VE1.
- 5.2 The Husky Trough type cable tray shall meet or exceed the following NEMA load classification:

| | |
|----------------------------------|----------------------------------|
| 8A (50lbs. per ft./8ft. Span) | 16A (50lbs. per ft./16ft. Span) |
| 8B (75lbs. per ft./8ft. Span) | 16B (75lbs. per ft./16ft. Span) |
| 8C (100lbs. per ft./8ft. Span) | 16C (100lbs. per ft./16ft. Span) |
| 12A (50lbs. per ft./12ft. Span) | 20A (50lbs. per ft./20ft. Span) |
| 12B (75lbs. per ft./12ft. Span) | 20B (75lbs. per ft./20ft. Span) |
| 12C (100lbs. per ft./12ft. Span) | 20C (100lbs. per ft./20ft. Span) |

6.0 UL

- 6.1 The cable tray system shall be classified for use as an equipment ground and requires that the minimum cross sectional area be shown on the tray labels. The industry standard is to mark each straight section and fitting with its own cross sectional area. It is the responsibility of the installer and/or user to assure that the capacity of the overall system is adequate to meet the anticipated ground fault of the system.

7.0 Manufacture and Data

- 7.1 The following data shall be provided with the quotation:
 - (a) Simple beam load and deflection tables
 - (b) Drawings illustrating tray quoted and splice connection
- 7.2 Tray shall be manufactured in accordance with and by a member of NEMA VE1.

- 1.0 Specification for Husky Techtray / Wire Mesh Cable Support System**
- 2.0 Manufacturer:** MPHusky
- 3.0 Product Description:** Husky Techtray is a wire mesh cable tray system that utilizes high mechanical strength steel wire that is welded into a grid system. This grid system is then formed into channel trays which support and carry cables. The wire mesh will consist of a 2" x 2" grid system, and will utilize wires that have a minimum diameter of .16" (4mm).
- 4.0 Material:** Standard tray finish shall be mill galvanized. Other finish options include Electroplated Clear Zinc, Hot Dipped Galvanized after fabrication, Painted or Stainless Steel.
- 5.0 Safety Edge:** Wire mesh system shall have continuous top edge wire that is T-Welded on top of support wires to avoid sharp edges that may damage cable or installer.
- 6.0 Fittings:** Shall be fabricated in the field by cutting wires with a cutting device. Cuts shall be made in a manner reducing sharp edges and projections so they do not harm cables or installation personnel. Manufacturer shall offer corner connectors that provide a radius on the inside corner of bends for horizontal 90 degree bends, tees, and crosses.
- 7.0 Straight sections** shall be provided in 10' (3m) lengths.
- 8.0 Wire mesh** shall be welded at all intersections.
- 9.0** Mesh system will permit continuous ventilation of cables and maximum disposition of heat. Tray shall be manufactured by a member of NEMA in accordance with NEMA VE-1 and shall be installed in accordance with NEMA VE-2

1.0 Specifications for Husky Fiberglass Cable Tray

2.0 Cable Tray Design

- 2.1 Cable Tray System shall be made of straight sections, fitting and accessories as defined in the latest NEMA FG-1.
- 2.2 Straight section structural elements: side rails, rungs and splice plates shall be pultruded from glass fiber reinforced polyester or vinyl ester resin.
- 2.3 Pultruded shapes shall be constructed with a surface veil to insure a resin-rich surface and ultraviolet light resistance.
- 2.4 Pultruded shapes shall meet ASTM E-84, Class 1 flame rating and self-extinguishing requirements of ASTM D-635.

3.0 Construction

- 3.1 Straight section lengths will be 120 inches (10ft.) or 240 inches (20ft.) standard.
- 3.2 Side rails will be inward "C" configuration and be pre-drilled to accept splice plates.
- 3.3 Loading depths for cable tray systems shall be 5", 3" or 2" as per NEMA FG-1 tolerances. Overall heights shall be 6", 4" and 3" respectively.
- 3.4 Loading classifications and test specimens shall be per NEMA FG-1.

4.0 Fitting

- 4.1 Molded fittings shall be formed with a minimum 3" tangent following the radius.
- 4.2 3" or 5" loading depth systems shall have 90° and 45° molded fittings in 12" or 24" radius.
- 4.3 All fittings not included in 3.5.2 should be of mitered construction.
- 4.4 Width—usable inside tray width shall be 6"-9"-12"-18"-24"-30"-36". Outside widths shall not exceed inside by more than 2".
- 4.5 Straight and expansion splice plates will be of stainless steel or fiberglass design with an eight bolt pattern in 5" fill systems and four bolt pattern in 3" and 2" fill systems.
- 4.6 Dimension tolerances will be per NEMA FG-1.
- 4.7 Cable tray must have integral connection between side rails and rungs consisting of non-metallic mechanical fasteners and adhesive bonding.

5.0 Manufacture

- 5.1 All manufacturing practices will be in accordance with NEMA FG-1.

1.0 Specifications for Husky Centray Center Rail Cable Tray**2.0 Material**

The tray shall be manufactured from 6063-T6 high strength aluminum. The spine shall be a minimum of 3" high and 1-1/2" wide. The top and bottom portions of the spine shall have a 0.145" minimum thickness and the vertical web portions of the spine shall have a minimum thickness of 0.098". The rung shall be a minimum of 0.50" wide by 0.50" high. The rung shall be a minimum of 0.060" thick. The ends of the rungs shall be rounded to prevent damage to cables and injury to personnel.

3.0 Construction

The spine shall be punched so as to minimize distortion from punching of rung holes for insertion of rungs. The rungs shall be inserted through the holes in the spine and fastened by high pressure staking in four locations to assure that the rungs are secure and prevent loose rungs. The splice connector shall also be usable as a hanger with a 1/2" diameter hanger rod. The splice connector shall use two bolts per connection that pass through the spine in the horizontal direction.

4.0 Wall Mount Trays

Wall mount trays shall be constructed in the same manner as above, except rungs shall protrude 1/2" from the spine on the back side. Wall mount tray shall be mounted to the wall in three locations per 10' or 12' straight section. The tray shall be mounted using 3/4" spacers supplied with the section for rung clearance and to compensate for irregularities in the walls.

5.0 Loading

Top mount trays shall meet NEMA 12C (100lbs/ft.—12ft. span) loading requirements. Top mount trays shall meet CSA Class D (179kg/m—3m span) loading requirements. Bottom mount trays shall meet NEMA 12B (75lbs./ft.—12ft. span) loading requirements. Bottom mount trays shall meet CSA Class C (97kg/m—3m span) loading requirements.

6.0 Widths

All widths are measured to the inside of the rungs, except for bottom rung mount 6", 9", and 12" wide trays. These widths include an additional 1-1/2" for the spine width. (Example: a 6" wide bottom mount width is 7-1/2").

7.0 Manufacturer

Tray shall be manufactured by a member of NEMA and tray shall be manufactured in accordance with the latest NEMA or CSA requirements.

1.0 Specifications for Husky Way Tray**2.0 General**

- 2.1 Cable tray systems shall be of the design of one manufacturer and shall be designed so that there are no burrs, projections, or sharp edges to damage cable insulation.
- 2.2 Fittings shall have the same load carrying capacity as straight sections. Fittings shall be of the continuous arc type with a 12, 24 or 36 inch radius unless otherwise shown on the drawings.
- 2.3 Trough type tray straight sections shall be 10' or 12' long and shall be of the width indicated on the drawings to provide the planned cable capacity.

3.0 Material and Construction

- 3.1 Trough type cable tray sides shall be 3-3/8", 4", or 6" deep.
- 3.2 Tray shall be Aluminum, Galvannealed, Steel Mill-Galvanized (ASTM A-653), or 304 or 316 stainless steel.
- 3.3 Trough bottom shall be of solid flat sheet type construction. Flanges on straights and fittings shall point inward.

4.0 Splice Joints

- 4.1 Resistance across any splice connection shall not exceed 330 microhms.
- 4.2 Splice connector design shall be universal for use on straight sections and fittings.
- 4.3 Splice connectors shall be of the high pressure bolted type with a minimum of four bolts per connector.

5.0 Manufacture

- 5.1 Tray shall be manufactured by a member of NEMA in accordance with NEMA VE-1 and shall be installed in accordance with NEMA VE-2

1.0 General

- 1.1 A complete metal enclosed bus system shall be provided; including all necessary fittings, tap boxes, enclosure, connectors, entrance fittings, insulated conductors, electrical connectors, terminating kits, and other accessories as required.
- 1.2 The bus system shall be suitable for indoor or outdoor use with conductor spacing and ventilation maintained throughout the system.
- 1.3 All elements of the bus enclosure shall be so designed as to eliminate any sharp edges or projections that may injure personnel or conductor insulations.
- 1.4 The bus system shall be CABL-BUS, as manufactured by MPHusky.

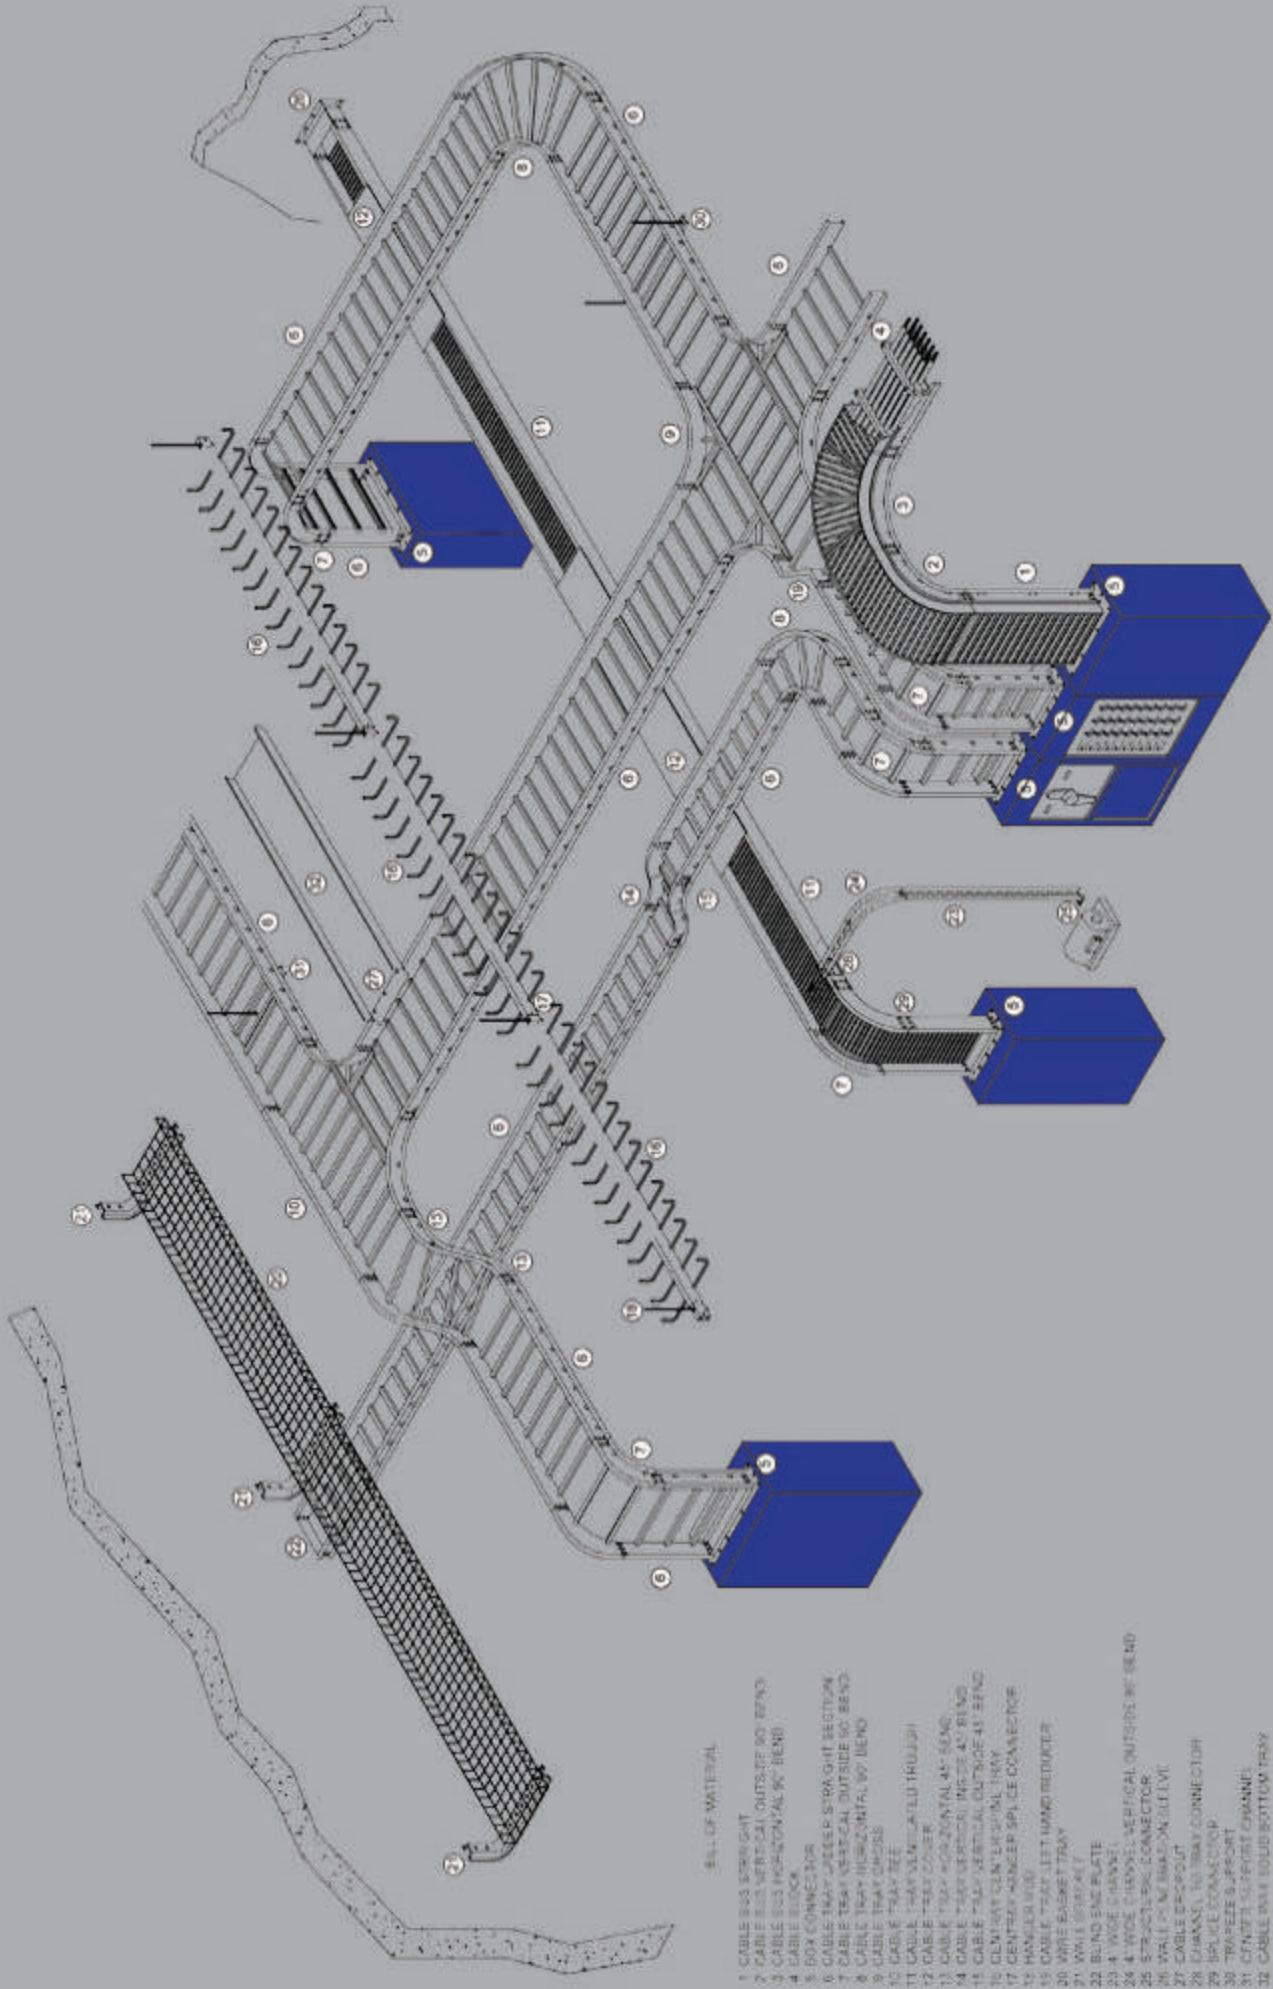

2.0 Construction

- 2.1 All load carrying members of the bus system shall be fabricated from extrusions of aluminum alloy 6063-T6. The maximum allowable stress used in designed shall be 10,000 PSI.
- 2.2 Bus enclosure fittings shall normally have a radius of 24 inches, however we offer fittings with other bending radii as required.
- 2.3 The top and bottom enclosure sections shall be corrugated to provide mechanical strength and slotted for ventilation. The top cover shall be fastened to the enclosure with self tapping screws spaced approximately 2 feet on centers and shall be removed for inspection. The bottom section shall be factory installed by welding.
- 2.4 Splice joints between sections of the bus enclosure shall be the high pressure splined bolted type design which avoids any structural weakness at the connection and does not exceed the electrical resistance specified under Section 3.4 of this specification.
- 2.5 Conductor support blocks shall be designed in segments to maintain a minimum of one conductor diameter in both the horizontal and vertical planes, as required for free air conductor rating. Horizontal runs will have blocks spaced every 36" and vertical runs every 18".

3.0 Electrical

- 3.1 All current carrying conductors shall have insulation rated for 90°C operating temperature in accordance with ICEA publication #P-46-426 and interim STD #1 to ICEA publication #S-66-524 for the ampacity and voltage specified.
- 3.2 The conductors shall be phased and supported to maintain low impedance and assure the mechanical strength necessary to prevent cable movement or damage under short circuit currents up to 100,000 RMS symmetrical amps.
- 3.3 Conductors shall be of continuous length and be pulled in after the bus enclosure is in place. Electrical connectors shall be used only at the termination of conductor runs or, if necessary, at tap points. All electrical connectors shall be provided by MPHusky.
- 3.4 The bus enclosure shall have a continuous current rating of not less than 1,000 amperes (50°C Rise) and the resistance across the enclosure section splice shall not exceed 50 microhms.
- 3.5 The bus enclosure shall be grounded at sufficient intervals for the purpose of preventing a potential above ground on the bus enclosure in the event of a fault.
- 3.6 The conductors shall be arranged in a phasing pattern which exhibits minimal inter-phase and intra-phase imbalance.
- 3.7 Conductor temperature rise calculations and current balance calculations can be provided in support of Section 3.6 of this specification.
- 3.8 All transposing of cables must occur at termination points. Transposing of cables will not be done in the bus housing.
