**INTRODUCTION**

Decade after decade, for over 60 years, MP Husky continues to be the trusted and proven name in Cable Tray. With more systems installed in more industries and environments than any other manufacturer, you can rest assured MP Husky has the experience and capability to meet your most demanding requirements. As we begin another decade, MP Husky is stronger than ever and positioned to lead the industry with the latest innovations, eco-friendly products, and engineering and manufacturing technologies. Our focus continues to remain on providing unmatched customer support, investing in our people, protecting the environment, and providing the most technologically advanced and engineered systems.

**MPHusky - Engineered to Support Powerful Reputations.**

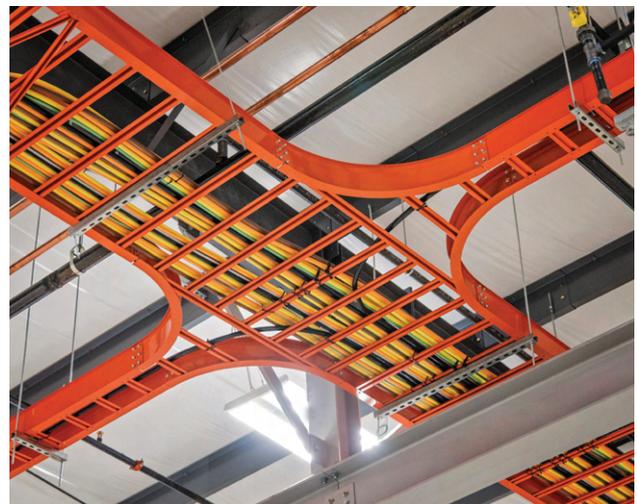

**DESCRIPTION & SELECTION**

Cable tray systems provide rigid structural support for cables in a variety of commercial and industrial applications. The basic styles of cable tray are: Ladder, Trough, Wire Basket, EMI, Pan, and Channel. For a more comprehensive description of the construction and utilization of these types of tray, see the appropriate catalogs and brochures for the products.

**Husky Ladder**

Ladder consists of two longitudinal side members connected by individual transverse members. It is intended for use primarily for power cable or control cable support and excels in heavy loading and longer span applications. It is available in I-Beam, Flange-In, and Flange-Out designs.

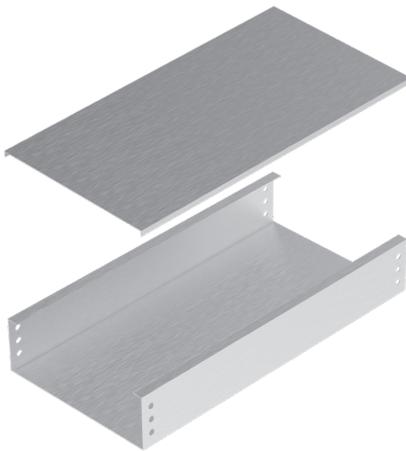

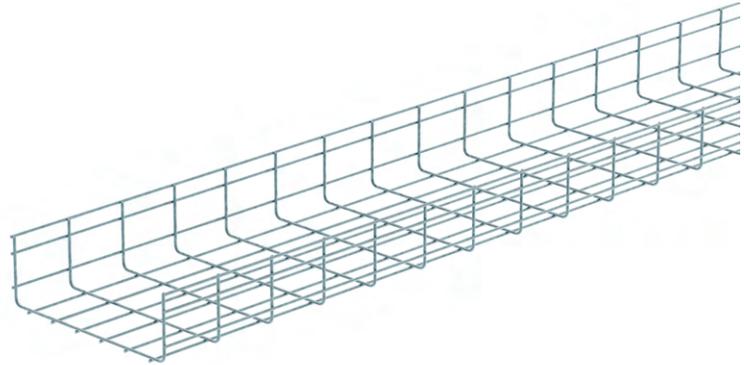

**Husky Trough**

Husky Trough can be ventilated or non-ventilated. Ventilated trough has a slotted corrugated, perforated bottom or 4" rung spacing. Solid bottom trough has a corrugated, 06C corrugated or F04 flat sheet bottom.

DESCRIPTION & SELECTION

**Husky Wire Basket**

Wire basket is a wire mesh cable tray system that utilizes high mechanical strength steel wire that is welded into a 2" x 4" grid system. Wire basket is typically used to carry data communication and fiber optic cables, with a huge degree of flexibility during installation due to capability and ease of fabricating fittings in the field.

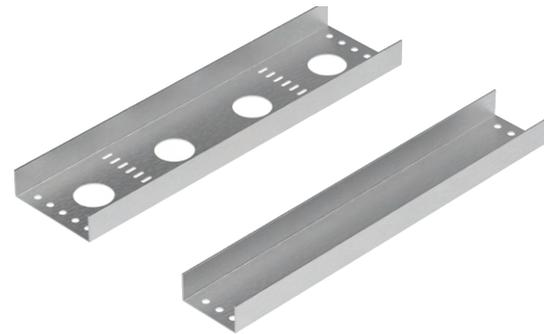

**Husky Pan Tray**

Husky Way straight sections are one piece formed pan that provides a smooth flat bottom and a fill depth that is almost the same as the outside height of the tray. With a cover it provides complete protection for your cables (*cover sold separately*).

**Husky Channel**

Channel is a one piece support with either ventilated or solid bottom sections. These sections are used with power cables, multiple control, or signal circuit cables. Channel is often used to make drops from the primary cable tray to equipment below such as motors, etc. Ventilated channel has slots for cable ties.

**Husky EMI Tray**

Electromagnetic Interference protection enclosures are completely contained and used to protect sensitive cables from interference caused by electrostatic and electromagnetic fields as well as plane wave radiation and cross talk.

## LOADING

Cable tray is used in a wide variety of applications and under widely varying conditions, it is important to gain an understanding of material specifications and structural design, and apply that knowledge when selecting trays and specifying fittings, parts, and accessories. Some of the considerations are:

### 1. NEMA Class / CSA Class

Using the charts on the next page, determine the correct class of tray as it relates to the desired loading capacity per foot and support span. The weight of the cable and at what span it will be supported need to be known also.

### 2. Material

MP Husky cable tray is available in aluminum, stainless steel, hot dip galvanized after fabrication steel, pre-galvanized steel, galvanized steel, and fiberglass.

### 3. Tray Depth

The depths of tray available range from 2" to 10".

### 4. Tray Width

The standard widths available are 6", 9", 12", 18", 24", 30", and 36" (many other widths available in wire basket tray).

### 5. Tray Type

The seven types of tray available are: Ladder (Flange-In, Flange-Out, and I-Beam), Trough (Flange-In and I-Beam), Channel, Fiberglass, Pan Tray, EMI, and Wire Basket. Ladder tray is available with either 6", 9", 12", or 18" rung spacing; both Channel and Trough are available with either solid (non-ventilated bottom) or ventilated bottom.

### 6. Radius of Fittings

The standard radii for fittings are 12", 18", 24", 36", or 48" and are designed in the style and material to match any tray selection.

## NEMA LOAD CLASSIFICATION

The National Electrical Manufacturers Association (NEMA) has standardized the classification of cable tray based on the load to be carried per foot, and the distance between span supports. The load per foot should include not only the cable, but also additional load factors for wind, snow, ice, etc. For more information on loading, see page 6 in this section.

LOADING

*MP Husky manufactures Cable Tray in accordance with NEMA Standards NEMA VE-1 and CSA C22.2 No. 126.1*

OUR QUALITY POLICY

MP Husky is committed to producing only the highest quality products that meet or exceed our customers' expectations and requirements. Our goal is to achieve 100% customer satisfaction by delivering the best products and services. We will achieve this individually and corporately through tested and proven processes and controls, in our Quality Systems, with a constant focus and effort on continuous improvement.

NUCLEAR PROGRAM

MP Husky is audited in conformance with 10 CFR50 Appendix B - Nuclear Standards by the U.S. Nuclear Regulatory Commission. Appendix B to Part 50 - Quality Assurance Criteria for Nuclear Power Plants and Fuel Processing Plants. This appendix establishes quality assurance requirements for the design, manufacture, construction and operation of those structures, systems, and components. The pertinent requirements of this appendix apply to all activities affecting the safety related functions of those structures, systems, and components; these activities include designing, purchasing, fabricating, handling, shipping, storing, cleaning, erecting, installing, inspecting, testing, operating, maintaining, repairing, refueling, and modifying.

- We have and continue to serve over thirty nuclear plants around the world
- MP Husky has been compliant for over 45 years
- We are the ONLY cable tray manufacturer to be 10 CFR50 Appendix B compliant
- We are audited every three years by members of the Nuclear Procurement Issues Committee using the Nuclear Procurement Issues Committee Audit Checklist (NUPIC Audit Checklist)
- The scope of the audit is to ensure that our Quality Assurance Program (QAP) is compliant with ANSI N45.2 and 10 CFR50 Appendix B

MATERIALS & CONSTRUCTION

Cable tray systems are commonly fabricated from a corrosion resistant metal or from a metal with a corrosion resistant finish. The selection of the proper material is essentially an economic consideration.

Every cable tray installation places requirements on the mechanical properties of the material from which it is fabricated. These properties influence the spacing frequency of supporting members, and the ease of installation. The selection of the material may also be dependent upon electrical (conductivity), physical (appearance), or chemical (corrosion resistance) properties, according to the demands of the specific installation. Although there are numerous metals available that can satisfy the basic requirements, certain wrought aluminum alloys and low carbon steels meet these requirements most economically.

**Wrought Aluminum Alloys**

Pure aluminum is soft and ductile. However, most commercial uses require greater strength than pure aluminum

affords. This strength is achieved by the addition of other elements to produce alloys which singly, or in combination, imparts strength to the metal. These alloys have been classified into seven categories according to their chemical composition, and have been given numerical designations (1000 through 7000) by the Aluminum Association for each series of alloy. In addition to alloying the pure aluminum, further strengthening is possible by heat treating or cold working (non-heat-treatable alloys).

**Heat-Treatable Alloys**—the initial strength of alloys in this group is enhanced by the addition of such alloying elements as copper, magnesium, zinc and silicon, and are designated as 2000, 6000, and 7000 series. Since these alloys individually, or in various combinations, show increasing solid solubility in aluminum with increasing temperature, it is possible to subject them to thermal treatments which will yield pronounced strengthening.

**Non-Heat-Treatable Alloys**—the initial strength of alloys in this group depends upon the hardening effect of elements such as manganese, silicon, iron, and magnesium, individually or in various combinations.

The non-heat-treatable alloys are designated as 1000,

3000, 4000, and 5000 series. As these alloys are work-hardenable, further strengthening is made possible by various degrees of cold working, denoted by the “H” series of tempers. Alloys containing sizeable amounts of magnesium, when supplied in strain-hardened tempers, are regularly given a final elevated temperature “stabilizing” to ensure stability of properties.

In determining the proper aluminum alloy for structural applications, such as ventilated cable tray systems, the design engineer should recognize the advantages inherent in using alloys that are heat-treatable and advantages of being able to fabricate the structure from materials possessing known minimum values of yield strength.

Cable tray products are most widely formed from the 6000 series alloys. Alloys in this group contain silicon and magnesium in approximate proportions to form magnesium silicide, which makes the alloys capable of being heat-treated. Major alloys in this series are 6061 and 6063, which are among the most versatile of the heat-treatable alloys. Though not as strong as most 2000 or 7000 alloys, the magnesium-silicon or (magnesium silicide) alloys possess good formability and corrosion resistance.

Basic structural members of aluminum cable tray systems can be made from 6063-T6 aluminum extrusions, a material that meets the requirements of the majority of installations and is economical. The 6063-T6 alloy has adequate strength and good corrosion resistance, it is light weight, maintenance free and because of the non-magnetic properties of aluminum, keeps electrical losses to a minimum.

**MP Husky manufactures Cable Tray in accordance with the latest edition of NEMA Standards Publication VE-1 and CSA Standard C22.2 No. 126.1.**

## MATERIALS &amp; CONSTRUCTION

## Steel

Steel cable trays are used principally in environments that are relatively free from corrosive attack. The most widely used corrosion resistant finish for steel trays is hot dip galvanized after fabrication. The main advantages of using steel in cable tray fabrication is its high strength and low cost. Its disadvantages include increased structural weight, poor corrosion resistance, and low electrical conductivity.

The idea that all steels are the same, except for its chemical disposition is false. Carbon steels may be produced with chemical compositions (carbon, manganese, phosphorus, sulfur, and silicon) within the specified limits of a given grade and still have characteristics that are widely dissimilar. Each grade and quality variation has a useful place, depending upon the end use and the methods of fabrication.

Basic components of steel cable trays are normally fabricated from either hot-rolled or cold-rolled steel strips of commercial quality. Steels in this category are ASTM A1011 CS Type B (formerly ASTM A569) and ASTM A1008 CS Type B (formerly A366). Pre-galvanized steel and Galvannealed steel conform to ASTM A653 (formerly ASTM A525).

## Stainless Steel

Today, hundreds of different alloy combinations exist for the endless variety of applications that utilize stainless and heat-resisting steels. The primary elements added to obtain the various properties required in stainless include chromium, nickel, manganese, silicon, molybdenum, and the stabilizing elements of titanium, columbium, and tantalum.

Stainless steel contains at least ten percent chromium, along with other elements, to develop specific properties. Depending on the quality of the elements present in a stainless alloy, it will have a metallurgical structure that will be characteristic of the basic stainless steel groups. Metallurgists refer to these groups as the martensitic, ferritic, austenitic, and precipitation hardening stainless steels. All standard austenitic alloys are given numbers in the 200 and 300 series, while the martensitic and ferritic alloys are numbered in the 400 series. MP Husky offers cable trays and accessories in the 316 series. This austenitic alloy is remarkable in several aspects. Unlike

the other two classes, 316 contains nickel in quantities from 4 to 22 percent, while the percentage of carbon is kept relatively low. When chromium is increased for improved corrosion resistance, nickel must also be increased to retain the austenitic structure.

316 Stainless Steel has molybdenum added to improve corrosion resistance and high temperature strength. The carbon content is also lowered to improve welding performance.

**If your job calls for stainless steel, please contact the MP Husky factory for assistance in determining the correct system for your specific application.**

**MATERIALS & CONSTRUCTION**

**Typical Applications include:**

**Type 304**

- Beer barrels
- Chemical equipment
- Coal hopper linings
- Cooling coils
- Cryogenic vessels and components
- Dairy equipment
- Evaporators
- Food handling equipment
- Milking machines
- Nuclear vessels and components
- Oil well filter screens
- Pressure vessels
- Sanitary fittings and valves
- Shipping drums
- Still tubes
- Textile dyeing equipment
- Hypodermic needles
- Feedwater tubing

**Type 316**

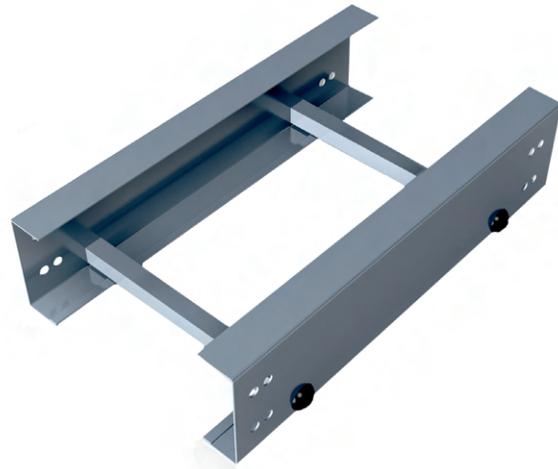

- Chemical processing equipment
- Chemical storage and transportation tanks
- Food processing equipment
- Steam cooking kettles
- Oil refining equipment
- Paper pulp digesters and evaporators
- Petroleum refining equipment
- Pharmaceutical processing equipment
- Scrubbers for environmental control
- Soap and photographic handling equipment
- General applications in textile industry

**Fiberglass**

MP Husky's Fiberglass Cable Tray systems are manufactured from glass fiber-reinforced plastic shapes and provide the load capacity of steel, plus the inherent characteristics afforded by our Pultrusion Technology: non-conductive, non-magnetic, and corrosion resistant. Although light in weight, the strength to weight ratio surpasses that of equivalent steel products. MP Husky's Fiberglass Tray will not rust, nor does it ever require painting. It is available in both polyester and vinyl ester resin systems, manufactured to meet ASTM E-84, Class 1 Flame Rating and self-extinguishing requirements of

ASTM D-635. MP Husky's Fiberglass Cable Tray comes in gray or blue (polyester resin) and beige (vinyl ester resin) but is available in custom colors upon request.

For more than 40 years, MP Husky's Fiberglass Cable Tray systems have been tested and proven in the harsh environment of the offshore oil and gas industry. Our tray has stood up to the test of being exposed to the corrosive conditions inherent in petroleum products, plus the daily punishment of exposure to wind, weather, and salt water.

**MP Husky's  
Fiberglass Cable Tray  
is the perfect choice  
for harsh environments.**

## CORROSION RESISTANCE

The underlying causes of corrosion are the same for all metals, all stemming from electrochemical phenomena. But the ways which the corrosion manifests itself are characteristic of each particular metal. Steel corrodes in the atmosphere with the formation of rust, which develops very rapidly on unprotected surfaces. In a clean atmosphere, aluminum slowly develops a white or silver gray patina.

Aluminum surfaces weather by a characteristic of pitting and corrosion rates are often assessed by measuring the depth of the pits. The rate of pitting falls off after the first year or two, moving gradually to a standstill.

The strong, heat-treatable alloys of aluminum, with copper as one of the chief alloy elements, or certain fully heat-treated alloys with magnesium and silicon as major alloying elements, may manifest another type of attack, intercrystalline in nature, which may cause more pronounced loss of strength if allowed to continue. Such materials may require protection by painting, cladding, or metal spraying, depending on the environment.

Several characteristic modes of corrosive attack may be distinguished as follows:

**Simple Chemical Attack**—the solution of a metal by an acid is an obvious example of simple chemical attack. Simple chemical attack occurs when sulfides are in contact with steel or copper. Ordinarily, aluminum is not subject to such attack. A classic example of such chemical attack is sludge retaining rain water in the bottom of guttering. In this case, a corrosive solution is held in constant contact with the metal, and rapid attack may follow.

**Electrochemical Corrosion**—Accelerated corrosion of a metal through contact with another metal in moist or wet conditions is known as bimetallic or electrolytic corrosion. This corrosion is due to the action of a simple voltaic cell. The presence of a conducting solution is essential to this phenomenon but the presence of dissimilar metals is not essential provided that a difference of potential exists.

For any pair of contacting metals in the following Galvanic Potential list, the one listed higher is anodic and will corrode when in the presence of saline water or atmosphere. In addition to the nature of the two metals, the extent of galvanic attack depends upon many other factors that include:

- Concentration of the electrolyte, which determines its electrical resistance
- Nature of ions present in the electrolyte
- Polarization effects
- Effect of stable surface films on the metal
- Relative areas of anode and cathode
- The physical nature of the corrosion product
- Temperature variations

Each of these factors can influence the total resistance of the circuit. The following Galvanic Potential list is a compilation of solution potentials of metals and alloys with respect to a calomel electrode. This list provides an initial guide to the possible effects of bimetallic contact.

The corrosive nature of sea water and coastal environments is partly due to the low electrical resistance of salt solution. Similarly, the bad effects of industrial atmospheres on metals arise largely from the sulphur compounds and sulphurous and sulfuric acids, which are largely formed as a result of burning coal, that dissolve in the moisture in the air or rain as it falls, or in films of condensed water on the metal.

The extent and type of moisture is an important factor in determining the severity of galvanic attack. For indoor service, where wetting is infrequent, galvanic corrosion normally is no problem. Outdoors, attack may be relatively rapid in sea coast and industrial environments, where contamination, hence conductivity of rain and condensed moisture is high.

Several general rules can be applied in selecting metal combinations for use in corrosive environments. These include:

- Select metals as close together in the galvanic series as possible.
- For the anodic protection of steel, metals above steel in the series should be selected, or the steel should be galvanized or have some form of coating.
- Avoid combinations having a smaller area of the more anodic metal than of the cathodic, to avoid excessive current density on the anodic areas.
- Insulate dissimilar metals wherever possible to minimize galvanic corrosion.

**Protected End (*Cathodic or Most Noble*)**

**Aluminum Alloys**

The corrosion resistance of aluminum alloys is due to the surface presence of a very thin protective film of aluminum oxide that has strong self healing properties when damaged. The oxide film begins to form on the surface of the bare metal immediately after exposure to air. The film grows rapidly for several days, then slowly until it reaches a thickness of approximately 0.0000002". Corrosion of aluminum can only occur when the oxide film is damaged or removed and conditions prevent its formation.

Substances that may come in contact with aluminum can be divided into three groups:

**Substances that attack the oxide film** These include the majority of strong alkalis, mercurical compounds, and most strong acids.

**Substances that cause localized breakdown of the oxide film (pitting)** Aluminum is suitable only under certain conditions, such as some natural fresh waters and aqueous solutions containing traces of mercury, copper, or other heavy metals.

**Substances that do not attack the oxide film**

The majority of substances fall in this group, including many industrial chemicals.

The majority of aluminum installations provide satisfactory service, free from corrosion, and only in exceptional cases do problems occur. When problems do occur, they can be attributed to one or more of the following causes:

- Wrong choice of alloy
- Exposure conditions
- A bimetallic joint that causes galvanic corrosion
- Crevices
- Unwise location of the aluminum assembly, resulting in deposition corrosion
- Contact with aggressive chemicals

Among the heat-treatable alloys, the 6000 series has adequate resistance to industrial and marine atmospheres.

With the exception of certain corrosive chemicals, no corrosion at all will occur if water is not present. Thus, indoor installations that are not in contact with water or installations that are maintained in dry conditions will not corrode.

## CORROSION RESISTANCE

## Steel with Zinc Coatings

In order to determine the performance of different types of zinc coatings in a corrosive environment, data from various atmospheric tests is collected and reviewed by American Society of Testing Materials. From the results of these tests, the following conclusions can be made:

**The corrosion rate of zinc** on galvanized sheets is practically linear in industrial or rural atmospheres, and in a marine atmosphere that is polluted with industrial contaminants. In these atmospheres, a sheet with double the weight of coating than that of another sheet can be expected to last twice as long before rusting of the base metal occurs.

**The composition of the base metals** has no measurable effect on the life of zinc coatings. However, the composition of the base metals is the major factor in the years to perforation.

**The corrosion rate of zinc** varies more with the type of atmosphere (marine or industrial) than does that of steel or iron.

**The chloride content of sea air** apparently has an accelerating effect on the corrosion of zinc coating.

**Rainfall removes about 75% of the corrosion products** from zinc surfaces, if the results of tests in rural, industrial, and marine exposures are averaged together. The residual corrosion products remaining on the surface become basic in character and exert a retarding influence on corrosion. In highly industrialized or polluted atmospheres, this basic film may not exist, leading to the more rapid attack experienced in these atmospheres.

**Indoor atmospheres** Variations in humidity and temperature indoors are somewhat less extreme and there is no rainfall indoors to dissolve and remove soluble corrosion products. The general assumption is that zinc coating of the same thickness has five times greater protective life when placed indoors rather than outdoors in the same locality.

**The indoor corrosion of zinc** may be severe when moisture condensation is frequent and air circulation is restricted. This effect is particularly bad in humid, tropical locations with nightly condensation.

These conclusions indicate zinc coatings will have an acceptable service life expectancy regardless of how the end point of failure is defined. It should be noted that whenever maintenance, such as painting, is neglected, it is unreasonable to expect galvanized steel to last indefinitely.

## Finishes

Cable trays fabricated of steel can be protected from corrosion by coating with another metal using one of the following methods:

- **Continuous Hot-Rolled Galvanizing**

*ASTM Designation Specifications for Zinc Coated (Galvanized) Iron or Steel Sheets, Coils, and Cut Lengths*—This process applies a zinc coating to sheet steel prior to fabrication of the product (pre-galvanized cable tray) by passing the metal downward through a molten ammonium chloride flux bath, and then into the zinc and out again by means of rolls.

The MP Husky standard zinc coating designation is G90, which has an average zinc coating weight of 1.25 ounces per square foot of steel for an average coating on both surfaces of 1.06 mils.

- **Galvannealed**

*ASTM Designation ASTM A653 CS Type B Standard Specification for Steel Sheet, Zinc Iron Alloy Coated (Galvannealed) by the Hot-Dip Process*—This process applies a zinc coating to sheet steel prior to fabrication of the product by passing the metal downward through a molten ammonium chloride flux bath, and then into the zinc and out again by means of rolls. After galvanizing the material is further annealed to a gray dull matte finish that has excellent paint adhesion properties.

The MP Husky standard Galvannealed coating designation is A60.

- **Hot Dipped Galvanizing After Forming**

*ASTM Designation A123 Specification for Zinc Coating (Hot Dip) on Assembled Steel Products*—This process is used to apply a zinc coating to an already fabricated product. The product is first cleaned in a caustic bath, then further cleaned by a pickling acid bath. The article is then thoroughly rinsed and dipped in a bath of molten zinc. The

## CORROSION RESISTANCE

nature and thickness of the coating depends largely on the immersion rate, temperature of the bath, immersion period, and withdrawal rate. The resulting coating consists of an outer layer of relatively pure zinc, and lower layers of iron-zinc compounds.

Generally, hot dip coatings are non-uniform, except on very simple shapes and are usually thickest at small recesses (unless these remain uncoated altogether). The advantage of this method is that the zinc applied is thicker than when applied by other processes. However, the protective characteristics of zinc coating under atmospheric conditions have been found to be equal, regardless of process: i.e. zinc coatings of the same weight have approximately the same service life.

- **Zinc-Plated**

*ASTM Designation B633*—Standard Specification for Electro-deposited Coatings of Zinc on Iron and Steel. Wire basket and many accessory and hardware items are Zinc-Plated for protection against corrosion.

- **Epoxy Coated**

Trays can be epoxy coated to provide protection against corrosive elements and chemicals. Epoxy is often used in combination with hot dip galvanizing to provide a two part protection against harsh environments.

- **Powder Coated**

Trays are powder coated for corrosion protection as well as just for appearance reasons. Trays can be powder coated in a variety of colors.

- **Anodized**

Aluminum trays are often anodized to provide corrosion protection. This process is often used on aluminum tray when used near salt water. Anodizing can also be used to provide a unique color appearance. However when an aluminum tray is anodized the electrical conductivity is reduced.

DESIGN LOADING

This section presents guidelines for classification of design conditions with respect to weather factors, methods of determination and application of various types of loadings encountered, maximum allowable working stresses, and other pertinent considerations. This information will assist the designer in evaluating materials and product catalog information so that he/she can design a system that will achieve the desired strength and rigidity at the lowest possible installed cost.

**Load Classification**

Loads on structures are usually divided into three types:

- **Dead loads** do not change their magnitude or their position during the life of the structure.
- **Live loads** that change their magnitude, their position and/or their direction during the life of the structure.
- **Dynamic loads** are caused by the motion of the live load or the movement of the structure.

Because of its general nature, this load classification can be used for any structure. However, for the purpose of establishing a practical load classification for cable tray system design, it is necessary to create additional subdivision, and provide a guide for assumption of specific loads. For cable tray system design, the three basic load types are also considered as follows:

**Dead Loads**

Since dead loads are the weight of the members that make up a tray or tray support, they have a known value. A summation of the weights of the individual members is all that is required to calculate the dead load.

**Live Loads**

In cable tray design, dynamic loads are considered to be as follows:

- **Design load** is the weight of cables, cable tray accessories, and sometimes workers (which vary in both magnitude and position). Cable-only design loads can be determined by adding the component weights of the system.

(Any provision for workers will require an assumption of magnitude and position for practical purposes, an assigned weight acting at mid-span of the tray).

- **Parasitic loads** such as ice, snow, wind, traction, and electromagnetic forces exist only because the tray exist. They are the most difficult to determine, and different assumptions can be made about their affect on the overall loadings. The following information will provide a general guide.

Three general degrees of loading due to weather conditions are recognized in the National Electrical Safety Code (NESC), and are designated as heavy, medium and light loading.

Values used in determining conductor loadings under these conditions for ice, wind, and temperature are given in **Table 1 (Degrees of Loading Due to Weather)**.

**Table 1**

Degrees of Loading Due to Weather National Electrical Safety Code Values			
Condition	Heavy	Med.	Light
Radial thickness of ice (in)	0.50	0.25	0.00
Horizontal wind pressure (lbs/sq ft)	4	4	9
Temperature (°F)	0	15	30

However, modifications of these values are necessary when applied to cable tray systems, since the NESC is concerned primarily with the construction of overhead supply and communication lines. Such modifications are as listed below:

- a. **Ice Loading**—The NESC loading of 1/2" thickness is applied to both cables and cable tray. In applying loadings to interlocked armored cables, and bare stranded conductors or suspension cables, the coating of ice is considered as a hollow cylinder with an inside diameter equal to the outside diameter of the cable or strand. Ice is assumed to weigh 57 lbs per cubic foot.
- b. **Snow Loading**—The NESC does not consider snow loading, and in general this also applies to cable tray systems. However, in the case of a solid cover on a tray, the minimum load of 5 lbs per square foot should be used for outdoor installations where snow is a factor.

DESIGN LOADING

- c. **Wind Loading**—The NESC loadings are modified as follows, in order to provide adequate protection against the maximum wind velocities encountered with consideration of the shapes of the various structures (not considered by NESC).

**Wind Velocity**—In the loading tables, wind means horizontal wind. Wind velocity will be considered to be true wind speed, corrected for instrumentation errors. Any variation of velocity with height is not considered; all structures will be under 100 feet in height, and 100% of the ground velocity is assumed to be adequate.

**Wind Loads**—The exteriors of all structures, with the exception of cylindrical structures, shall be loaded with a wind pressure normal to the surface having an intensity given by the formula:

$$W_p = C V_p$$

**Wp** = Wind Pressure in pounds per square foot

**C** = Coefficient depending upon the size, shape, and position of the structure in the wind and having values specified in *Table 2 (Shape Factors)*

**Vp** = Impact Pressure =  $0.00256V^2$   
(Where V = The design velocity).  
Values of Vp may be obtained from *Table 3 (Impact Pressures)*

Table 2

Shape Factors	
Structure	Shape Factor "C"
Isolated Structural Shapes	2.0
Trusses, Towers, Etc.	2.0
Wires, Cables, Etc.	1.2
Pipe Supports, Poles, Etc.	1.0

For trusses and towers the wind load is assumed to be acting on the projected area of the windward face only. For structures with circular cross sections, the affected area is the area projected on a vertical plane.

Table 3

Impact Pressures			
V (mph)	Vp (psf)	V (mph)	Vp (psf)
15	0.58	85	18.5
20	1.02	90	20.7
25	1.60	95	23.1
30	2.30	100	25.6
35	3.13	105	28.2
40	4.09	110	30.9
45	5.18	115	33.8
50	6.39	120	36.8
55	7.73	125	40.0
60	9.21	130	43.3
65	10.80	135	46.6
70	12.50	140	50.1
75	14.40	145	53.8
80	16.40	150	57.6

These values are for an air density of 0.07651 lbs per cu ft corresponding to a temperature of 60°F and barometric pressure of 14.7 lbs per sq in.

**Wind Direction & Distribution**—The allowance for wind pressure shall be made assuming the wind from any possible direction to be critical. Wind loads shall be considered uniformly distributed.

- d. **Traction Forces**—These forces are caused by the cables starting and stopping during the cable installation period, and they vary in magnitude and direction. They are of such nature that no general assumptions can be made to provide for them. However, the safety factors selected for the basic design stresses should be conservative enough to provide for these forces when they do occur.
- e. **Electromagnetic Forces**—These forces, caused by short-circuit current during a cable fault, vary in magnitude and position. It is impractical to make an assumption providing for them. Ordinarily, the safety factors selected for the

## DESIGN LOADING &amp; DEFLECTION

basic design stresses will be adequate. However, in installations where these forces are of such magnitude that they become a factor in the design of the cable tray system, adequate provision must be made so that the design stresses are not exceeded.

### Dynamic Loads

In cable tray design, dynamic loads are considered as follows:

- **Impact loads**—result because the live load is in motion, are loads in addition to the static weight of the live load. Such loads could be caused by cables being dropped onto it, or by workmen walking on it or climbing up or down a ladder leaning against a tray. These loads are provided for in the same manner as traction forces. The safety factors selected for the basic design stresses should be conservative enough to provide for these forces if they occur.
- **Inertia loads**—Are caused when the structure itself is in motion, such as may occur during an earthquake. An earthquake is considered to give the structure a horizontal acceleration, and the resulting acceleration and deceleration cause forces proportional to the mass and to the acceleration and deceleration. These loads represent special design requirements, and the design loading should be in accordance with the ASA's "*American Standard Building Code Requirements for Minimum Design Loads in Buildings and Other Structures*" or other suitable specifications.

### Design Loadings

Basic cable trays are designed on the basis of maximum allowable stress for a certain section and material. Therefore, the allowable cable load will vary with span, type and width of tray. The design loadings for cable tray are given in the form of load tables. These tables are located on pages 33 through 57.

The design loadings are to be used for designing standard supports, which necessitates assuming design loadings for the cable trays to be supported.

The concept of "Cables in Free Air" for power distribution and control cables has been adopted primarily for economic reasons. Cable tray support systems should be designed, whenever possible, for minimum installed

cost. In order to achieve this objective, the engineer must bear in mind that the general design rules established for aluminum and steel structures are not always compatible with design rules for a cable tray system. This is particularly applicable in the case of restrictions on deflection.

Since the most economical cable tray system uses heat-treated aluminum alloys, or high strength steels with long spans, any limitation on deflection that will not permit the best utilization of material and design will increase the cost. By limiting the maximum fiber and shear stress used in the design, the adequacy and safety of the structure is ensured.

### Why Limit Deflection?

The primary reason to limit deflection in cable tray systems is appearance. Engineers and owners take pride in the appearance of their plants. Rigid restrictions on deflection of cable trays installed at eye level or in a prominent location are common. However, it is neither economical nor good engineering practice to restrict deflection of a cable tray system in less prominent areas.

### Methods of Decreasing Deflection

There are various ways to limit deflection of a cable tray. If the objective is minimal installed cost, the options should be considered in this order:

- **Decreasing stress by decreasing the bending moment** This can be accomplished by introducing restraining moments at the end of a span in the form of a rigid support. The deflection in a continuous beam, with negative bending moments at the intermediate support points, is only a fraction of the simple beam deflection.
- **Increasing depth of the tray** Deflection in any location can be reduced by increasing the depth of the load-carrying side members and/or by adding to their cross-sectional area. Adding to the depth generally utilizes the material most economically.
- **Increasing modulus of elasticity** Since the modulus of elasticity of steel is  $29 \times 10^6$  psi, and that of aluminum alloys is only  $10 \times 10^6$  psi, greater deformation of aluminum alloy trays is to be expected at any given stress level. Under its own weight, an aluminum beam will deflect the same amount as an identical steel beam, since not only

DESIGN LOADING & DEFLECTION

the weight, but also the modulus of elasticity is only one-third that of steel. However, under the same applied load (disregarding the beam's own weight), aluminum will deflect almost three times as much as steel. Therefore, consideration must be given to the choice of material for any one location, for an isolated run or for an entire installation.

- **Decreasing span length** For economic reasons, this method of reducing deflection should be a last resort, as it increases field labor considerably. However, it can be an effective means to improve the appearance of an installation when the number of spans to be reduced is small in comparison to the number in the entire installation.

**Deflection Criteria Applied to Cable Tray**

Design rules and specifications developed for steel cannot and should not be applied to aluminum alloys, as this would not permit the most economical use of these materials. Deflection criteria which apply only to steel, and should not be used when the most economical system is desired, include:

- **Span-deflection ratio** Example: Deflection is limited to 1/300 of the span by the National Electrical Manufacturers Association specifications for structures supporting air switches. While very important in that instance, as even slight deflection could cause misalignment in the operating mechanism and result in binding and difficult switch operation, the application of this specification to a cable tray is uneconomical and not recommended.
- **Depth to span ratio** Example: The American Institute of Steel Construction, in the specifications for buildings, defines the depths of beams and girders in floors to be not less than 1/24 of the span or not less than 1/20 of the span where shock or vibration may be encountered. This specification ensures a certain rigidity and levelness of the structure, which is important in that instance, but cannot be justified for cable tray systems because of the higher cost involved.
- **Deflection constant** Example: Deflection is limited to a certain amount by an engineering company for a tray system. While such specifications might make a system using 8 foot

spans look better, it prohibits the use of more economical designs with longer spans that have a much greater deflection and still look acceptable. Such a specification increases the cost of the tray system unnecessarily, especially if the trays are to be installed well above eye level.

**Summary**

As a guide, a span-deflection ratio of 1/200 satisfies most owners. This ratio provides an allowable deflection of 0.6" in a 10 foot span, 0.72" in a 12 foot span, and 1.20" in a 20 foot span under the actual loads encountered. Data for calculating deflection is presented in *Table 4 (Constants for Beam Deflections)*.

DESIGN LOADING & DEFLECTION

\*Maximum Deflection for Continuous Beams up to and including 5 Spans.

Formula	Calculation	Where
$\Delta = C \frac{WcL^4}{EI} = 1.92 \times \frac{5.65}{11.31} = 0.96 \text{ (in)}$		$\Delta$ Deflection (in)
		Wc Carrier Load (lbs/ft)
		L Span Length (ft)
		E Modulus of Elasticity (psi)
		I Moment of Intertia of Carrier Stinger (in <sup>4</sup> )
		C Values shown in table

Example: A cable tray with specified load has a simple beam deflection of 1.92 inches at mid-span. Find the deflection for the fifth span of the 5 span installation. From the table above, the maximum constant in the free beam columns is 11.31. Note that this is the center of the span. For the 5 span installation, the maximum constant in the 5 span column is 5.65, which is not in the center, but 7/12 of the span length from the support between spans 4 and 5. For maximum deflection of the fifth span see above.

ELECTRICAL EQUIPMENT & GROUNDING

A cable tray system must provide protection to life and property against faults caused by electrical disturbances, lightning, failures that are a part of the system, and the failure of equipment that is connected to the system. For this reason, all metal enclosures of the system, as well as non-current carrying or neutral conductors, should be

tied together and reduced to a common earth potential. This includes the structural steel of a building, all piping for water, gas, steam, sewers, tanks, well casings, down spouts, gutters, siding, and roofing. There are two distinct divisions to the grounding problem: System Grounding and Equipment Grounding.

ELECTRICAL EQUIPMENT & GROUNDING

The following explanation gives the reasons for grounding, and how to provide for it.

**System Grounding**

The purpose of system grounding is to drain off any excessively high voltages that may accidentally come on the tray system. If the system is properly grounded by means of a low-resistance conductor of sufficient capacity, the current will be carried off to earth immediately with minimum danger of fire or shock. In a grounded system, an accidental grounding of one of the current-carrying conductors will result in a short circuit, causing a fuse or circuit breaker to open.

**Equipment Grounding**

Equipment grounding means the connection to earth of all exposed, noncurrent-carrying metallic parts of the components of the distribution system. The purpose of this ground is to prevent a voltage higher than earth potential on cable tray or equipment. Therefore grounding reduces the danger of shock or fire in the event a live conductor comes in contact with these conductive parts.

**Methods of Grounding**

Effective grounding must be permanent and continuous, and have ample capacity to safely conduct any current likely to be imposed on it. It should also have impedance sufficiently low to limit the potential above ground and to facilitate operation of over-current devices in the circuit. A continuous, under-ground metallic water supply system is acknowledged to be the best electrical ground. Other suitable methods of grounding include continuous metallic steam and gas piping systems, the grounded metal framing of the building, or an artificial electrode such as a driven steel pipe, galvanized or otherwise protected from corrosion, or a buried metallic plate.

The tray system and equipment ground connections should be made to the same electrode at the service entrance, on the supply side of the equipment used for disconnecting the service. Equipment should be solidly tied in with the system ground. It is also important, that wherever multiple grounds are used, they be tied together in order to avoid any difference of potential between the various parts of the tray system.

Complete rules for grounding are contained in *Article 250 of the National Electric Code*.

**Electrical Properties of Cable Tray**

MP Husky has always recognized the importance of electrical design, as well as structural design, to provide positive, safe protection to personnel, facility, and equipment. Thorough testing has proven that the cable support system must be electrically designed for maximum carrying capacity. Based on this, Power cables may have short circuit capacity from 5,000 to 150,000 amperes, and the division of fault current places considerable burden on the support system, even though adequate grounding has been provided. **Table 5 (Division of Fault Currents)**, shows the division of fault current determined by tests of an aluminum and a steel interlocked armored 3 conductor 4/0 cable on a MP Husky aluminum cable ladder.

It is not the purpose or intent of the support system to be used for a continuous ground, but to provide extremely high, one second current-carrying capacity as a safety feature. The entire system should be grounded at periodic intervals to keep the potential at or below 100 volts in case of a cable fault. MP Husky cable trays are classified by Underwriters Laboratories® as to their suitability as an equipment grounding conductor only.

**Table 5**

Division of Fault Currents						
Fault Current Path	Steel Armored Cable			Aluminum Armored Cable		
	% through armor	% through ground wire	% through ladder	% through armor	% through ground wire	% through ladder
Armor and Ladder	50	—	50	23	—	77
Armor, External Ground Wire and Ladder	50	23	27	17	37	46
Armor, Internal Ground Wire and Ladder	5	74	21	9	54	37

TRAY SIZING

### Sizing Trays for Multiple Conductor Cables

NEC Section 392.22 lists the requirements for installing multiple conductor cables in ladder, ventilated trough, solid bottom trough, solid channel, or ventilated channel-type trays.

For ladder or ventilated trough trays, the diameter of all cables No. 4/0 and larger must be added together and the total must not exceed the width of the cable tray. Cables must be placed side by side. NEC Table 392.22(A), Column 1 is used for cables less than 4/0. These cables do not have to be placed side by side. NEC Table 392.22(A), Column 2 is used for a combination of cables rated larger than 4/0 and smaller than 4/0.

The total cross-sectional areas of the cables in trays with an inside depth of 6 or less, containing control and/or signal cables, must not exceed 50 percent of the cross-sectional area of the tray.

For solid bottom trays, the diameter of all cables No. 4/0 and larger must not exceed 90 percent of the cable tray width. NEC Table 392.22(A), Column 3 is used for cables smaller than 4/0. NEC Table 392.22(A), Column 4 is used for a combination of cables rated 4/0 or larger, or less than 4/0.

For trays with an inside depth of 6 inches or less, containing control and/or signal cables, the total cross-sectional areas of the cables must not exceed 40 percent of the cross-sectional area of the tray.

For ventilated channel-type trays, the total cross-sectional areas of all cables must not exceed 1.3 square inches for 3" wide trays, 2.5 square inches for 4" wide trays, or 3.8 square inches for 6" wide trays.

For solid bottom channel, the total cross-sectional area must not exceed 1.1 square inches for 3" wide, 2.1 square inches for 4" wide and 3.2 square inches for 6" wide trays.

### Sizing Trays for Single Conductor Cables

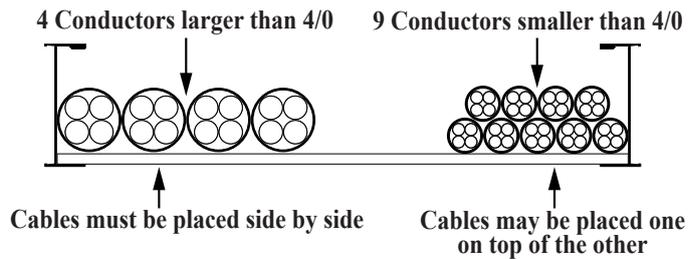

For ladder or ventilated trough trays, the total diameter of all cables 1000MCM and larger must not exceed the width of the cable tray. NEC Table 392.22(B)(1), Column 1 is used for cables 250kcmil through 900kcmil. NEC Tables 392.22(B)(1), Column 2 is used for a com-

bination of cables rated 1000MCM and larger, and smaller than 1000MCM. For ventilated channel trays, the total diameter of all cables must not exceed the inside width of 3", 4", or 6" wide trays.

#### Problem: Multiple Conductor Cables

What size ladder-type cable tray is required for 9 multi-conductor cables smaller than 4/0 and 4 multi-conductor cables larger than 4/0? The total diameter (in inches) for the 4/0 and larger cables is 12.6" and the total area for the cables rated less than 4/0 is 22 sq. in.

*Cable tray width must be selected from NEC Table 392.22(A) and be based on the calculation in column 2.*

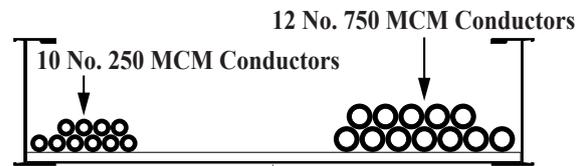

*Note: Square inch area of cables obtained from manufacturer.*

- Step 1: NEC 392.22(A)(1)(c)  
Sq. in. of cables, smaller than 4/0 = 22 sq. in.  
Diameter of cables larger than 4/0 = 12.6"
- Step 2: NEC Table 392.22(A) Column 2  
22 sq. in. + (12.6 x 1.2) = 37.12 sq. in.  
A 36" wide tray has 42 sq. in. area
- Answer: The inside width of the cable tray must be equal to 36"

#### Problem: Single Conductor Cables

What size tray is required for (10) No. 250 MCM RHH RHW copper conductors and (12) No. 750 MCM RHH RHW copper conductors laid in a ladder tray?

*Cable Tray must be selected from NEC Table 392.22(B)(1) and be based on square inch area shown in Column 1.*

- Cables may be placed on top of each other
- Step 1: 250 MCM = 0.554 sq. in.  
750 MCM = 1.286 sq. in.
- Step 2: NEC 392.22(B)(1)(b)  
.554 x 10 = 5.54 sq. in. + 1.286 x 12 = 15.43 sq. in.  
= 20.97 sq. in.
- Step 3: NEC Table 392.22(B) Column 1  
18" wide tray = 19.5 sq. in.  
24" wide tray = 26.0 sq. in.
- Answer: The inside width of the cable tray must be equal to 24"

**FORMULAS & CALCULATIONS**

**Calculate the load for a span shorter than the one shown in the load table.**

Formula: Take the load shown on a known span, multiply by the known span squared and divide it by the desired shorter span squared. See sample load table below. Calculate the load for a 10' span.

A()IJC5-(W)-144()									
NEMA Class	CSA Class	Support Span	SWL* lbs/ft (kg/m)	Deflection in (mm)	Part No.	UL EGC (amps)	LD (in)	FL (in)	Fitting Prefix
12C		12ft 10ft	122 (182) 176 (262)	1.15 (29.2) 0.80 (20.3)	A(RS)IJC5-(W)-(L)	1200	3.9	2.0	ALIJC5
SWL* stands for Safe Working Load									
RS stands for Rung Spacing									

Formula	Calculations	Where
$W_2 = \frac{W_1 \times L_1^2}{L_2^2} = \frac{122 \times 12^2}{10^2} = 176 \text{ lbs/ft on } 10' \text{ span}$		W <sub>2</sub>   Calculated load for the new span
		W <sub>1</sub>   Load shown in table above for 12' span
		L <sub>1</sub>   Span shown in table above
		L <sub>2</sub>   Desired Shorter span

**Calculate the deflection for the new load value of 176 pounds per foot on a 10' span.**

Formula: Divide the new known load for the 12' span by the desired load for the 10' span and multiply the result by the deflection for the known 12' span. See sample load table above. Calculate the deflection for the new load on 10' span.

Formula	Calculation	Where
$D_2 = \frac{W_1}{W_2} \times D_1 = \frac{122}{176} \times 1.15 = 0.80''$		D <sub>2</sub>   Calculated deflection for the new load
		W <sub>2</sub>   Calculated load for the new span
		W <sub>1</sub>   Load shown in table above for 12' span
		D <sub>1</sub>   Deflection shown in table above for 12' span

**Calculate the deflection for a load smaller than the load shown for the span in the load table.**

Formula: Divide the desired load by the known load shown in the deflection table and multiply the answer by the deflection shown for the known load in the deflection table. See sample load table above. Calculate the deflection for a load of 80 pounds per foot on a 12' span instead of 122 pounds per foot as shown.

Formula	Calculation	Where
$D_2 = \frac{W_2}{W_1} \times D_1 = \frac{80}{122} \times 1.15 = 0.754''$		D <sub>2</sub>   Calculated deflection for smaller load
		W <sub>2</sub>   Smaller load for the span
		W <sub>1</sub>   Load shown in table above for 12' span
		D <sub>1</sub>   Deflection shown in table above for 12' span

**FORMULAS & CALCULATIONS**

**Convert a load with a 1.5 safety factor to a load with a 2.0 safety factor.**

Formula: Multiply the load with a 1.5 safety factor by 0.75 to convert it to a load with a 2.0 safety factor. See sample load table below: Example: Convert 122 pounds per foot with a 1.5 safety factor to a load with a 2.0 safety factor.

A()IJC5-(W)-144()									
NEMA Class	CSA Class	Support Span	SWL* lbs/ft (kg/m)	Deflection in (mm)	Part No.	UL EGC (amps)	LD (in)	FL (in)	Fitting Prefix
12C		12ft 10ft	122 (182) 176 (262)	1.15 (29.2) 0.80 (20.3)	A(RS)IJC5-(W)-(L)	1200	3.9	2.0	ALIJC5
SWL* stands for Safe Working Load									
RS stands for Rung Spacing									

Formula	Calculations	Where
$W_2 = W_1 \times \text{Multiplier} = 122 \times 0.75 = 91.5 \text{ lbs/ft}$		$W_2$ Calculated Load with a 2.0 Safety Factor
		$W_1$ Load Shown in Table Above for 12' Span
		Multiplier Safety Factor Multiplier (0.75) for 2.0

**Convert a concentrated load to pounds per linear foot.**

Formula: Double the concentrated load and then divide the result by the support span. See sample load table above. Convert a 200 pound concentrated load to pounds per linear foot.

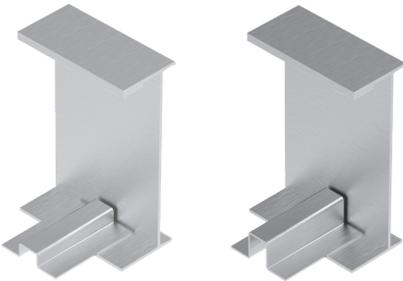

Formula	Calculation	Where
$W_E = \frac{2 \times CL}{S} = \frac{2 \times 200}{10} = 40 \text{ lbs/ft}$		$W_E$ Converted Concentrated Load to Pounds Per Linear Foot
		$CL$ Concentrated Load
		$S$ Span (ft)

The calculation above converted a 200 pound concentrated load on a 10 foot span to a 40 pound per linear foot load. Now that the concentrated load is in pounds per linear foot it can be added to the cable load that is also in pounds per foot for the 10 foot span. The 40 pounds per foot can be added directly to the cable load and compared to the loads shown in our load tables. This would result in a 1.5 safety factor on the cable load and the concentrated load. The 40 pounds per foot can be divided by 1.5 resulting in 26.7 pounds per linear foot. When you add 26.7 pounds per linear foot to the cable load the result is a 1.5 safety factor on the cable load and the concentrated load doesn't have a safety factor.

SLOTTED RUNG OPTIONS

**Slotted Hat Rung**  
(-SM)

**Slotted High Hat Rung**  
(-RM)

**Slotted Strut Rung**  
(-FM)(-IM)(-AM)

Slotted Rung Option Suffix Codes				
Rung Type	Hat Slotted	Flat Side Up	Flat Side Down	Every Other Rung Inverted
Slotted Hat Rung	-SM	----	----	----
High Hat Rung	-RM	----	----	----
Strut Rung	----	-FM	-IM	-AM

Slotted hat-shape rungs and strut-shape rungs are available as options for all I-Beam style trays (Except I6 & I8). The solid hat-shape rung is standard. Strut-shape rungs can be solid or slotted and have the flat side up, flat side down or an alternating design with every other rung inverted. Slotted rungs can aid in fastening cables down with zip ties. Slots are 7/16" wide by 1/4" and are located on 1" centers. A ( )I6 and A ( )I8 trays do not use these rungs and use an I-Beam style rung, (shown above), which is not available with slots. Slotted rungs are often referred to as marine rungs. Add the suffix code shown above to the end of the catalog number. Example: A9IXC-24-144-SM or ALIXC-24H90-24-SM (slotted hat rungs).

Horizontal Tee

Vertical 90 Degree Outside Bend

# I-BEAM CABLE TRAY FITTINGS

*Manufactured & Tested In  
Accordance With NEMA VE-1*

*Classified By UL As An Equipment  
Grounding Conductor*

*CSA Classified Trays Available*

 ( ) = Blank for standard Zinc-Plated Hardware, (-6S) for 316 Stainless Steel, or (-SB) for Silicon Bronze

The detail below shows the application of a wall penetration sleeve through a wall. This diagram also shows how to support a vertical tray running up a wall using wall brackets, a bracket angle to span between the wall brackets, and BKSA-IXD-C support angle clips to mount the tray to the bracket angle. For longer vertical runs, a vertical support 90 with SH-38 cable support hooks is recommended because the cables would be supported by Kellems Grips that hook over the SH-38 cable support hooks. On longer runs, intermediate cable supports such as MP Husky's cable support members and additional Kellems Grips, need to be added.

MID-SPAN SPLICES & QUARTER-SPAN EXPANSION SPLICES

ACCESSORIES & SUPPORTS

**Mid-Span Splices**

Optional mid-span splices can be placed at any location within a span, eliminating the need to have splices located within the quarter point of the span as shown in NEMA VE-2. This can reduce the cost of supports in the installation.

**Quarter-Span Expansion Splices**

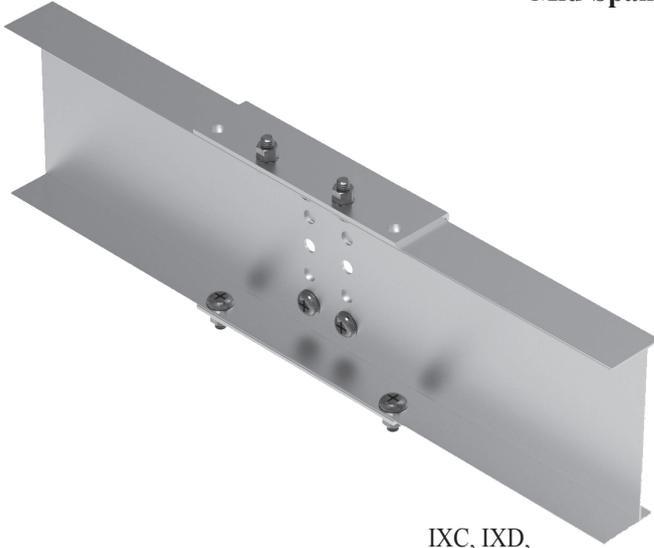

Optional quarter-span expansion splices can be placed at any location within the quarter point of the span without supporting both sides of the splice as outlined in NEMA VE-2. This can lower the installed cost of the system by reducing the number of supports required.

See the chart below for application information.  
Tray lengths need to be the same as the span length or longer.

# ENGINEERED CABLE TRAY

*Manufactured & Tested In Accordance With NEMA VE-1*

*Classified By UL As An Equipment Grounding Conductor*

*CSA Classified Trays Available*

Table of Contents	Page
Square Fittings	82
Large Radius Fittings	82
Cut-To-Length Tray	83
Factory-Installed Splices	83
Pre-Punched Ground Holes	83
Factory-Installed Separators	83
Drop-In Rung Modules	84
Stadium Tray	85
Walkable Covers	86

## ENGINEERED CABLE TRAY

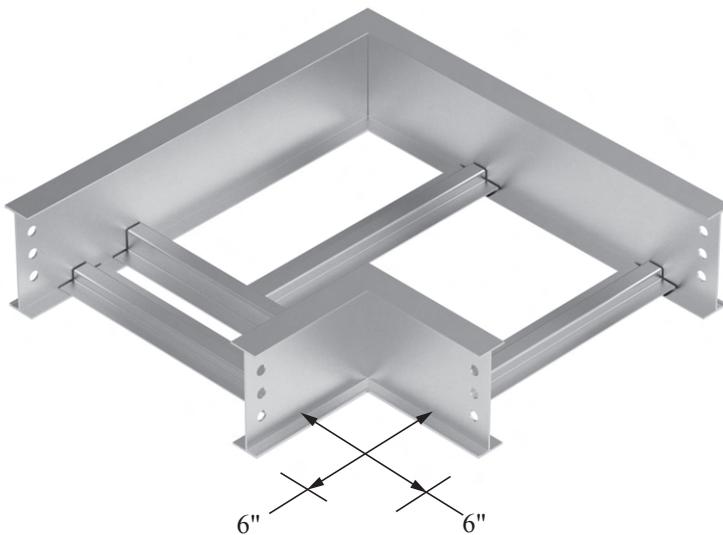

MP Husky strives to meet the standard product needs of our customers while also helping to solve unusual installation needs. We also want to offer labor saving opportunities on projects. For this reason, we now make custom-made products engineered to solve our customers' field challenges. Special design trays and services include the following:

- Square Fittings
- Large Radius Fittings
- Cut-To-Length Tray Sections
- Factory-Installed Splice Plates
- Factory-Punched Ground Lug Holes To Save Field Labor
- Factory-Installed Separators
- Drop-In Rung Modules
- Stadium Tray

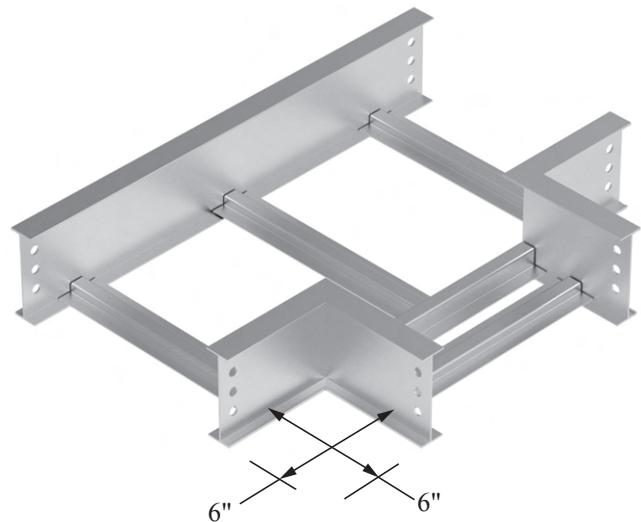

## SQUARE FITTINGS

Square fittings are offered for applications where standard fittings with a radius would not work as needed. These fittings have square inside and outside corners allowing them to fit in room corners or go around square corners while still hugging the wall. The ends extend only 6" from the inside corner of the bend. They are available in 30, 45, 60, and 90 degree, horizontal or vertical fittings as well as tees and crosses. We also offer 3" corner length fittings. See samples below.

Horizontal Bend

Horizontal Tee

## LARGE RADIUS FITTINGS

Large radius fittings are offered for applications where standard fittings would not work as needed. These fittings have a large radius custom-designed and bent to go around large equipment. We have supplied many large radius applications including tunnel applications. Consult MP Husky for further details on your specific application.

**CUT-TO-LENGTH TRAY SECTIONS**

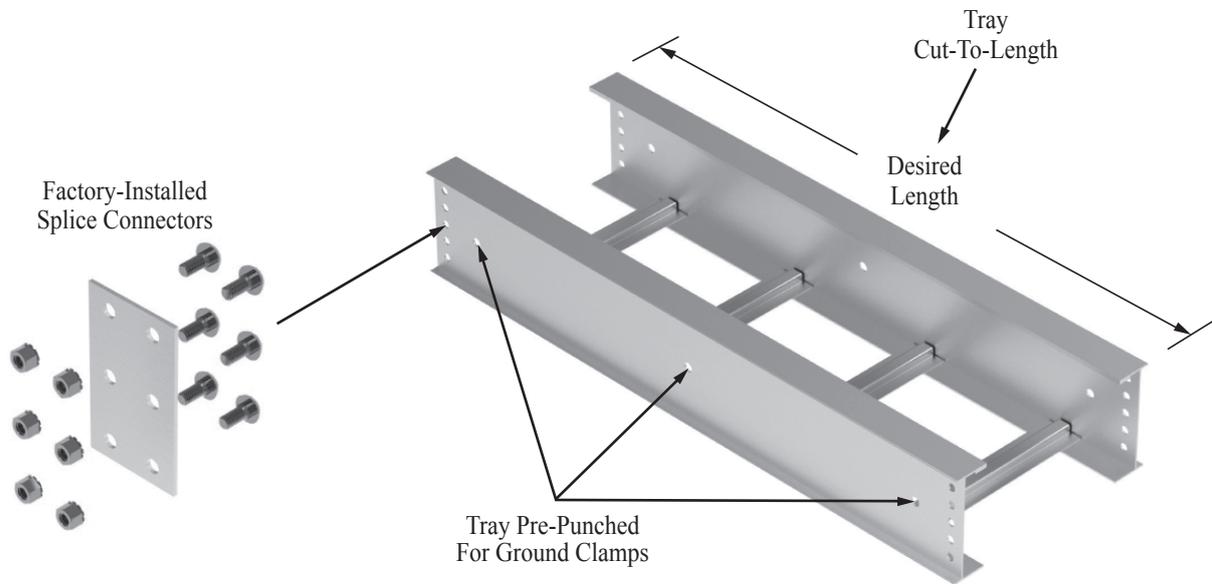

MP Husky can supply projects with cut-to-length tray sections. Each section will arrive at site cut to the proper length with end holes on both ends and the part number, including the length, printed on the label. This service can provide huge savings in installed cost by eliminating costly field labor to cut the tray to length and drilling of splice connector holes after cutting. Additionally, there will be less material drop from cutting, less cutting errors and the job will be completed faster, allowing you to get on with your next project. Contact the factory to find out how economical this service is. See Detail below.

**FACTORY-INSTALLED SPLICE CONNECTORS**

MP Husky can install splice connectors on one end of each straight section prior to shipment, reducing field installation costs. See Detail below.

**PRE-PUNCHED GROUND CLAMP HOLES**

MP Husky can pre-punch ground lug mounting holes in the tray before it ships to you. With today's labor cost, the tray can arrive at the jobsite with the ground holes already punched at a fraction of the cost, saving a considerable amount of installation labor. See Detail below.

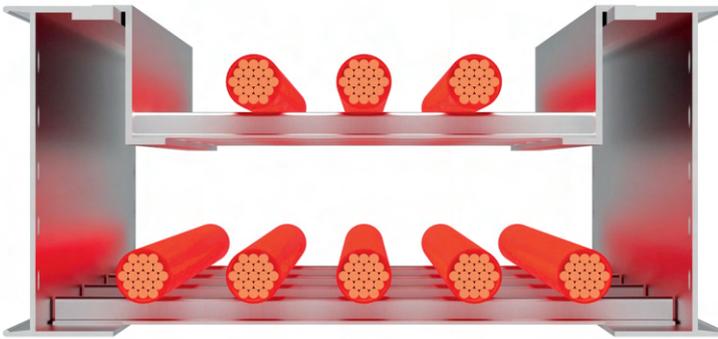

**FACTORY-INSTALLED SEPARATORS**

In some cases MP Husky can factory install separators providing additional savings in field labor.

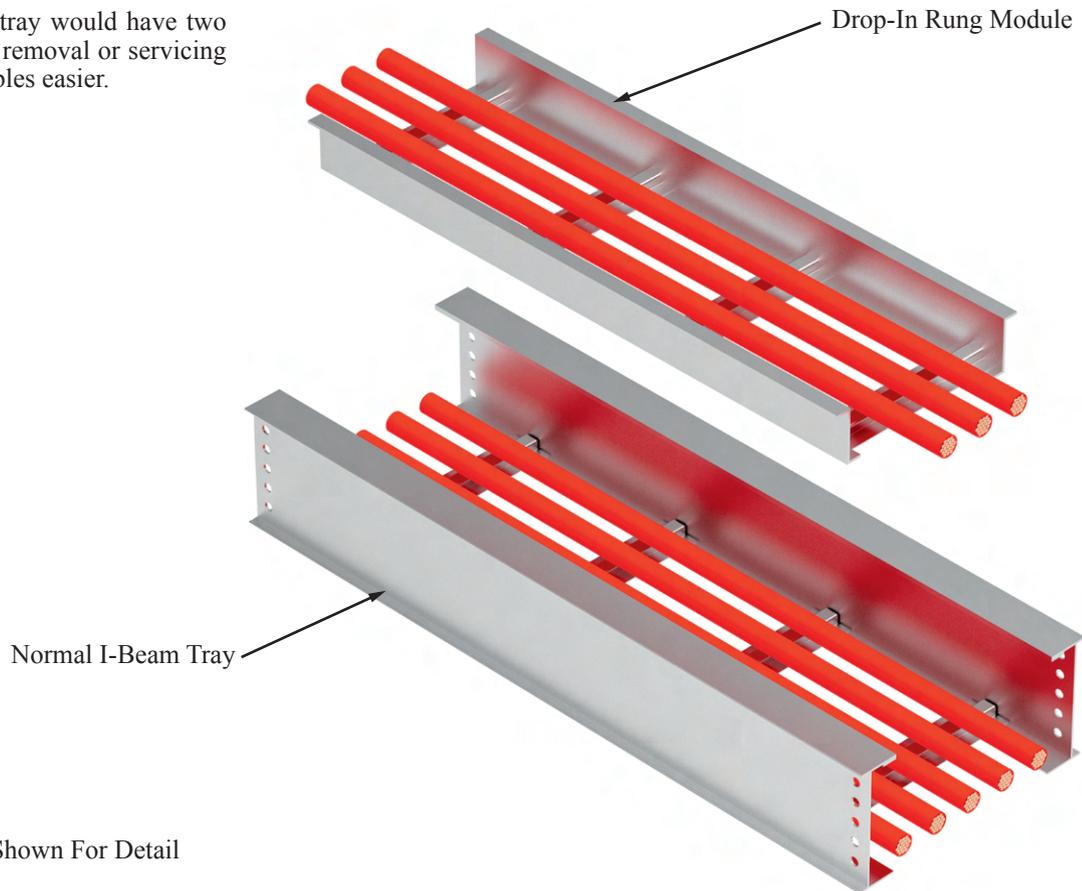

DROP-IN RUNG MODULE

Drop-In Rung Modules are available to provide a second layer of cable support in the same tray. Once cables are installed in the normal support area the module is dropped in from the top providing another level of rungs for cable placement. The rungs are mounted to a Z-member that slides in from the top of the tray and hangs on the upper flanges of the tray. The modules are about half the length of a straight tray section to make it easier to drop them in or remove them to get to the cables underneath for servicing.

ENGINEERED CABLE TRAY

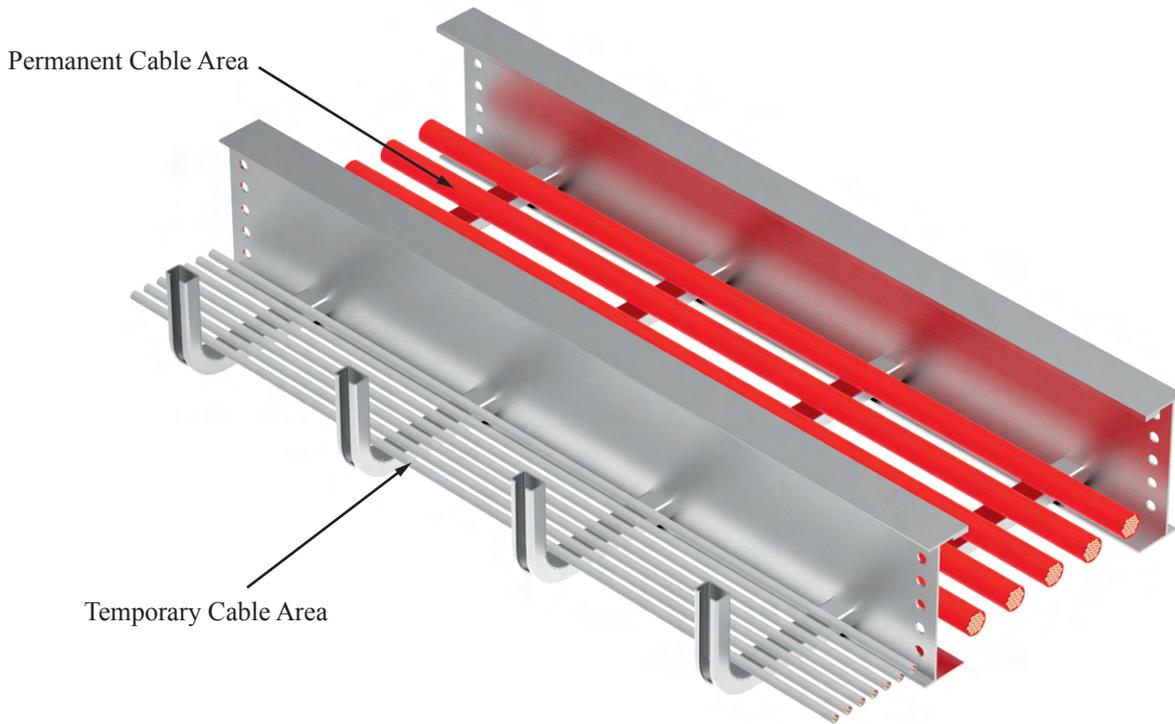

A 10' or 12' long tray would have two modules, to make removal or servicing the lower level cables easier.

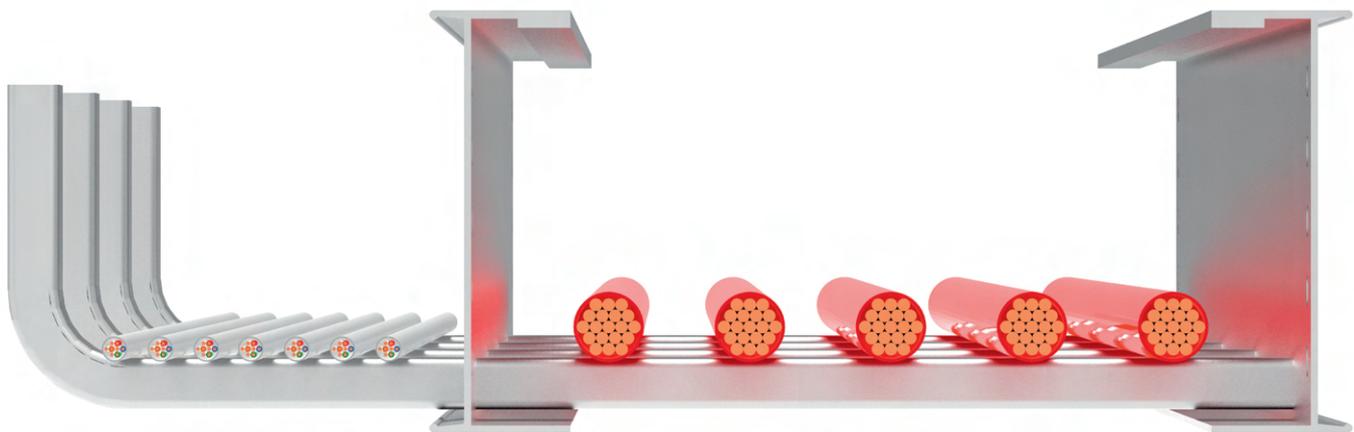

Note: Short Tray Shown For Detail

STADIUM TRAY

Stadium Tray is engineered to provide an area for permanent cables and an exterior temporary area that is easy to access for cable installation and removal. This system is very useful for a convention hall where trade shows are held or similar applications. The permanent cables would be installed between the hanger rods in the permanent section and kept separate from the temporary section. The open design of the temporary area allows cables to be laid in the tray without pulling and dropped to various locations as needed. The hook design prevents the cables from slipping out and keeps them in place. Cables are easily lifted out when the event is over. The rungs that turn up can be every rung or every other rung as desired. Rung caps are available to cover rung tips for cable protection.

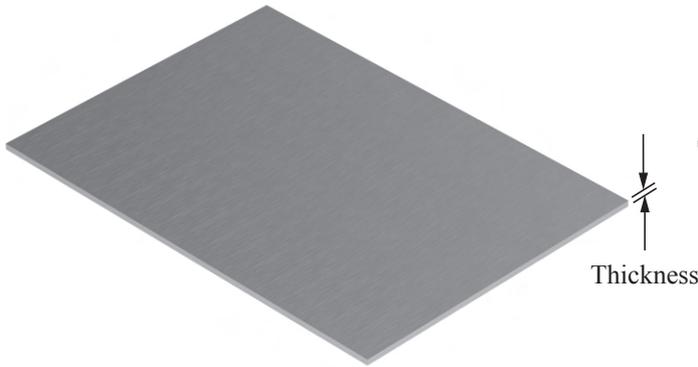

ENGINEERED CABLE TRAY

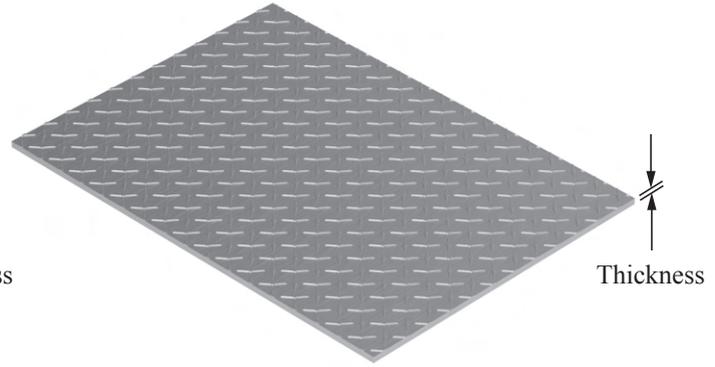

WALKABLE COVERS

Walkable covers are offered for areas where trays are mounted near floor level and may be stepped on or walked on. These covers are manufactured thicker than standard covers to yield more strength, making them more rigid in the event they are stepped on. Walkable covers are offered as flat sheet style or diamond plate style for non-skid use. These covers have been tested in various widths and thicknesses to ensure they will withstand the additional loading.

Flat Sheet Style

Diamond Pattern Style

WALKABLE ALUMINUM COVER CHART

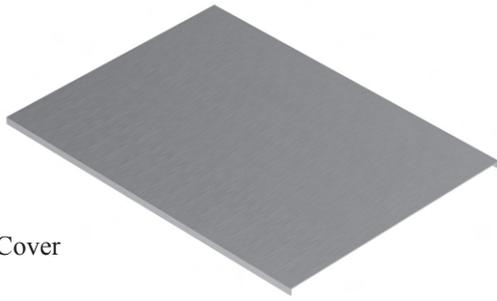

The chart below shows the required thickness for covers to withstand a 200 pound person stepping on the cover. There will be deflection until the load is removed. The cover could deflect into the cables in the tray. For less deflection use a thicker cover.

Width (in)	0.040" Thick (Standard)	0.063" Thick	0.080" Thick	0.125" Thick	0.250" Thick
6	No	Yes	Yes	Yes	Yes
9	No	Yes	Yes	Yes	Yes
12	No	No	Yes	Yes	Yes
18	No	No	No	Yes	Yes
24	No	No	No	Yes	Yes
30	No	No	No	No	Yes
36	No	No	No	No	Yes
42	No	No	No	No	Yes
48	No	No	No	No	Yes

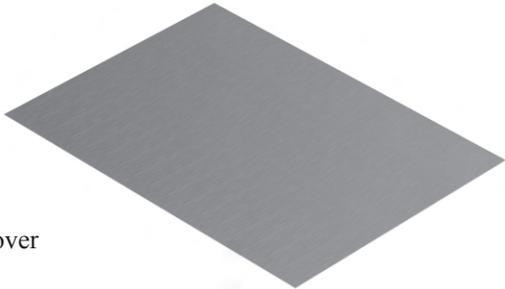

MP Husky does not recommend walking on any cable tray.  
Contact MP Husky for additional information.

SPLICES & CONNECTORS

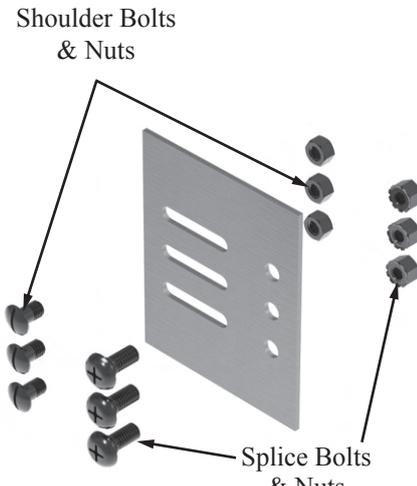

**Splice Plates**  
 Standard splice connectors used to join tray sections. Splices with one blank side can be used to connect to a competitors tray by field drilling.  
 3/8" hardware included See Detail "A" in Details on page 158.

Tray Type	Standard Splice	One Side Blank
IJA, IJB, IJC, IJD & IJC5	ASP-H2(-)-K	ASP-H2-1B()
IYA, IYB, IYC, IYB5 & IYC5	ASP-H6(-)-K	ASP-H6-1B()
IMB, IMC, IMD, IXA, IXB, IXC, IXD, IMC7, IXC7 & IXD7	ASP-M2(-)-K	ASP-M2-1B()
I6	ASP-E2(-)-K	ASP-E2-1B()
I8	ASP-I8(-)-K	ASP-I8-1B()

**90 Degree Splice Connector**  
 These splices can be used to make field tee's or to connect to cabinets.  
 3/8" hardware included

Tray Type	Catalog No.

IMB, IMC, IMD, IXA, IXB, IXC, IXD, IMC7, IXC7 & IXD7	ASP-6-90()
I6	ASP-I6-90()
I8	ASP-I8-90()

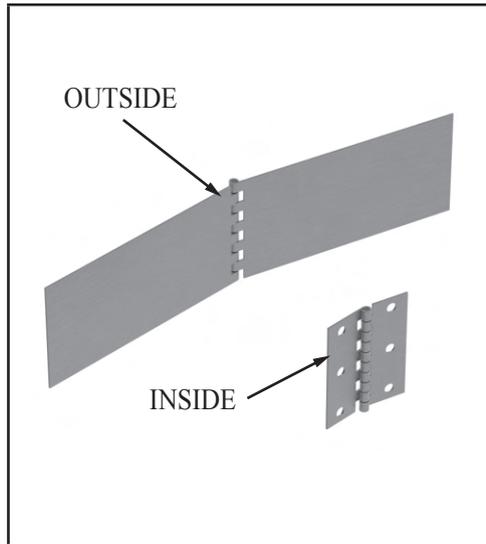

**Expansion Splice Connectors**  
 Expansion splice connectors are designed to allow 1-1/2" of free movement between adjacent straight sections. 3/8" hardware included. Bonding jumpers are required. See NEMA VE-2 for installation information.  
 See Detail "B" in Details on page 158.

SPLICES & CONNECTORS

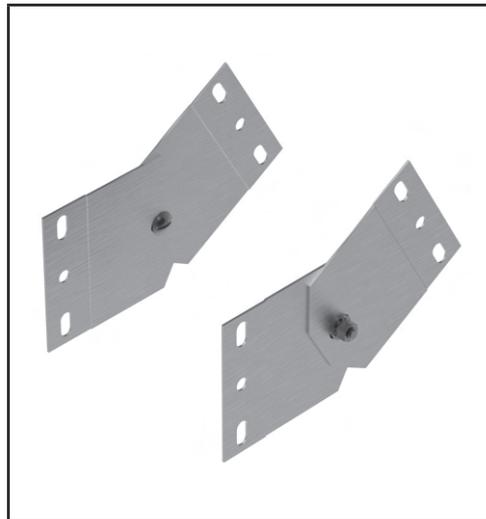

**Horizontal Hinge Splice Plates**

Horizontal hinged splices offer flexibility to go around obstacles during installation. Bonding jumpers should be used on each side rail. The long hinge is field drilled once the trays are at the desired angle.

3/8" hardware is included. See Detail "D" in Details on page number 159.

Tray Type	Catalog No.
IJA, IJB, IJC, IJD, IJC5, IYA, IYB, IYC, IYB5 & IYC5	AFS-H4(-)K

I6	AFS-VI6(-)K
I8	AFS-VI8(-)K

**Offset Reducing Splice Plates**

Offset reducing splice plates can be used instead of reducer fittings and offer better versatility and economy since they are less expensive and don't require covers. Use two plates for concentric reductions or one offset plate along with a standard splice plate for eccentric reductions.

3/8" hardware included.

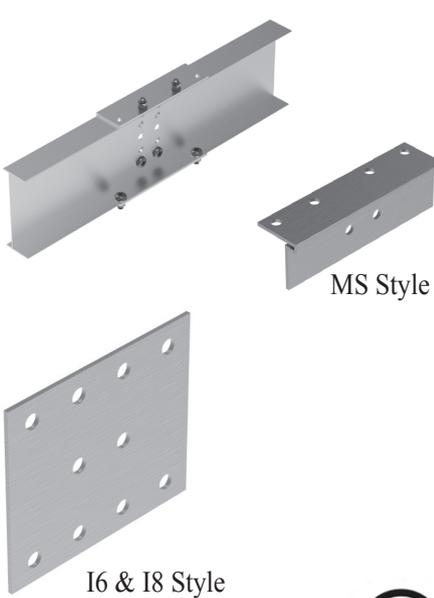

Tray Type	Catalog No.
IJA, IJB, IJC, IJD, IJC5, IYA, IYB, IYC, IYB5 & IYC5	ASP-HOR-(OFF)( )

-K = Kitted Hardware and Splice

SPLICES & CONNECTORS

MS Style

I6 & I8 Style

**Mid-Span Splices**  
 Optional mid-span splices can be placed at any location within a span, eliminating the need to have splices located within the quarter point of the span as shown in NEMA VE-2. This can reduce the number of supports and cost of installation. The mid-span splices need to be ordered separately. 3/8" hardware is included.

Tray Height	Tray Type	Catalog No.

SPLICES & CONNECTORS

**Step Down Splice Connectors**

Step down splices are used to connect two trays together of different heights, while keeping the bottoms of both trays lined up. These splice connectors are handy when you want to change the height of the tray during a run such as changing the tray you are running from 6" high to 4.5" high. Also used to adapt one tray type to another. Two pieces required. 3/8" hardware is included.

Tray Type	Catalog No.
5" to 4.5" High Trays	ASP-500/450( )

**Hardware for Splice Connectors**

Splice hardware is offered in standard Zinc-Plated steel finish. 316 Stainless Steel and Silicon Bronze (Non-Ferrous) are also offered.

Description	Catalog No.
3/8" x 3/4" Splice Bolt, Zinc-Plated	B-100
3/8" Splice Nut with Captive Lock Washer, Zinc-Plated	N-100
3/8" x 3/4" Splice Bolt, 316 Stainless Steel	B-100-6S
3/8" Serrated Flange Lock Nut, 316 Stainless Steel	N-100-6S
3/8" x 3/4" Splice Bolt, Silicon Bronze	B-19-SB
3/8" Splice Nut, Silicon Bronze	N-17-SB
3/8" Lock Washer, Silicon Bronze	W-17-SB

( ) = Blank for standard Zinc-Plated Hardware, (-6S) for 316 Stainless Steel or (-SB) for Silicon Bronze.

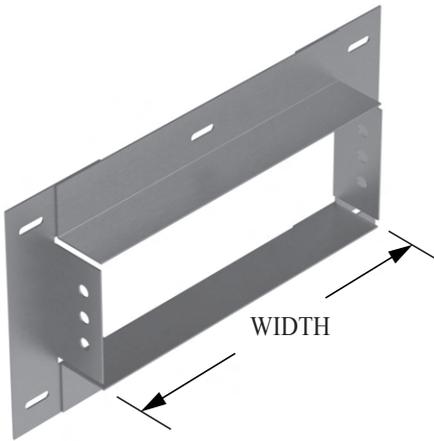

**BOX CONNECTORS & WALL PENETRATION SLEEVES**

**Drill Jigs**

Using drill jigs on field-cut ends ensures the proper alignment of holes, allowing full design strength of the splice. A splice plate can also be clamped to the side rail and used as a template for a small quantity of field cuts.

**BONDING JUMPERS**

**Laminated Aluminum**

AFS-C STYLE

**Braided Copper**

AFS-CT STYLE

**Green Insulated Copper**

AFS-CT INSULATED

**Bonding Jumpers / Grounding Straps**

Bonding jumpers are primarily used to jump across connections that are considered non-secure such as hinge splices or expansion splices. Jumpers should be installed on both side rails when jumping across hinge splices and expansion splices. When used as an EGC, jumpers should be installed on both side rails and the two jumpers amperage values should add up to the fuse rating of the equipment being protected. Many styles and amperages are available including:

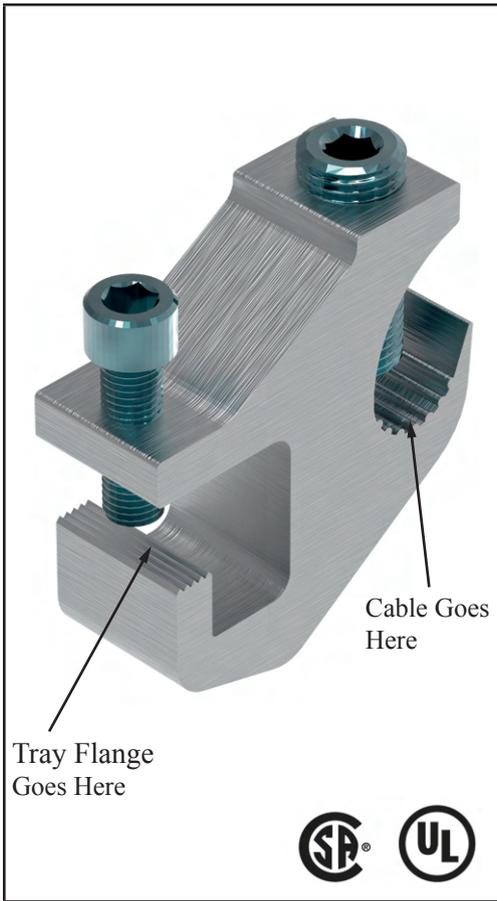

Laminated Aluminum, Green Insulated Copper, and Tinned Braided Copper. Jumpers are offered in two lengths 12" and 16" from bolt hole to bolt hole. Jumpers include mounting hardware. See Details "B", "C" and "D" in Details on pages 158 and 159.

( ) = Blank for standard Zinc-Plated Hardware, (-6S) for 316 Stainless Steel or (-SB) for Silicon Bronze.

**GROUND CLAMPS**

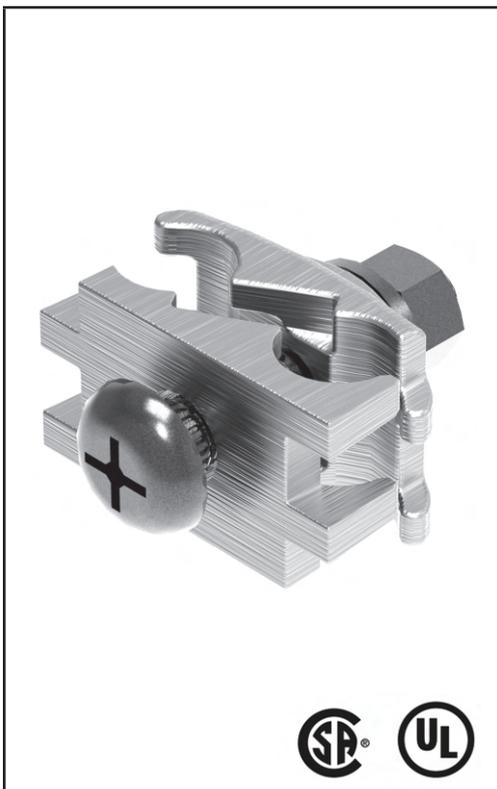

**Ground Clamps**

Ground Clamp for fastening ground wire to cable tray. Clamp is Tin-Plated extruded aluminum with zinc-electroplated steel hardware. Use for aluminum or copper conductors. Clamp has serrations to bite through insulating oxides on aluminum tray and grip the tray. Screws tighten with 1/4" hex wrench. See Detail "L" in Details on page 163.

**Grounding Connectors**

Type GC connectors hold a single through cable and a tap cable while separating the ground conductor from the cable tray. Note that the bolt head is mounted on the inside wall of the cable tray to avoid damage to the cable insulation. Grounding connector can be used with aluminum or galvanized steel cable trays and aluminum or copper conductors. When mounted, the bolt may be used to replace one of the bolts in a splice plate eliminating the need to drill the tray. When used on aluminum conductors the cable must be scratch brushed and Oxidation Inhibitor (OI) must be applied on the cable and connector. Clamps are copper alloy Tin-Plated. See Detail "K" in Details on page 163.

GROUND CLAMPS

GBM-29

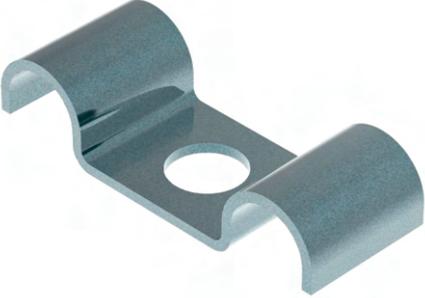

GB-29

**Grounding Clamps**

Type GBM high-copper alloy clamps hold a single through cable directly on the cable tray surface. One wrench installation and UL 467 listed. Copper alloy cast body with Durium bolts, nuts, and washers. Furnished in copper alloy, however, Tin-Plating is available as an option. GB-style clamps have a back piece that separates the cable from the tray surface.

UL listed. See Detail “L” in Details on page 163.

**Oxidation Inhibitor**

An oxidation inhibitor is used where permanent electrical continuity is important. For best results, clean contact surfaces from dirt and oil by wiping clean and remove oxide coating by abrasion once over with emery cloth. Apply a thin coat of oxidation inhibitor on the cleaned surfaces and make connection immediately. Each container of compound is sufficient to effect approximately eighty splices.

Description	Catalog No.
Oxidation Inhibitor	<b>OI</b>

SPLICES & ACCESSORIES

SEPARATORS

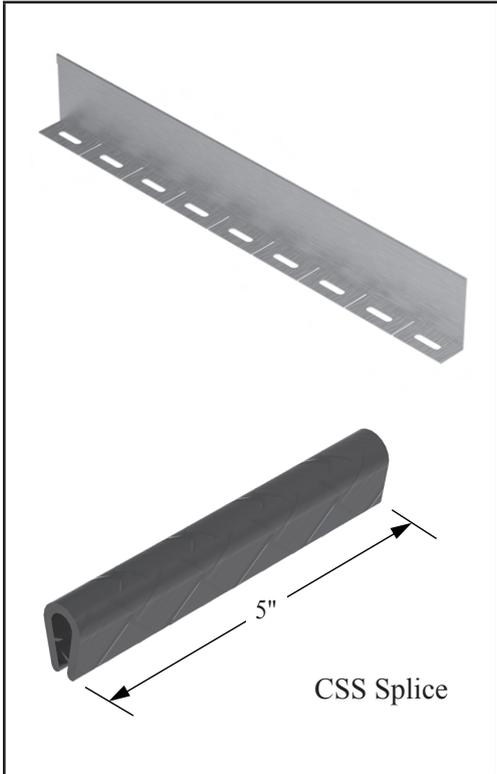

**Separators / Dividers**

Cable separators (dividers) are available for all tray types in aluminum, HDGAF, mill galvanized, galvanized, or 316 Stainless Steel. Separators come in various heights and are slotted at regular intervals for ease of installation without field drilling. Each separator is furnished with B-37 self-drilling self-tapping sheet metal screws for ease of mounting and one (CSS) separator splice. Stainless separators are furnished with stainless bolts, nuts, and washers. Optional separator mounting clips (SSUSC-U) with hardware are also available for mounting without drilling.

**Straight Lengths:** Standard length is 10 or 12 feet. For 10 foot lengths change the -144 to -120. Also available in 5 foot -60 or 6 foot -72 lengths.

Tray Height	Separator Height	Alum	316 SS
4.5"	2.75"	A3S-144()	63S-144
5"	3.75"	A4S-144()	64S-144
6" (I6 only)	4.75"	AI6S-144()	6I6S-144
6"	4.75"	A5S-144()	65S-144
7"	5.75"	A6S-144()	66S-144
8" (I8 only)	6.75"	AI8S-144()	6I8S-144

**Separators for Horizontal Bends**

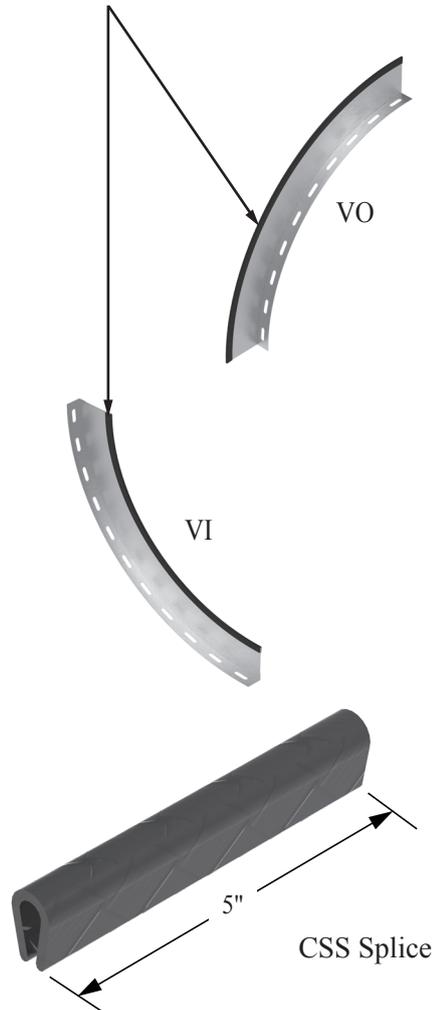

Separators for horizontal bends are supplied in the standard 6 foot length. Each piece is punched and slotted for easy field adjustment to any degree of radius curvature. Sections may be field cut or continued along a straight run. Self-drilling self-tapping screws and one (CSS) separator splice are included with each section. Stainless separators are furnished with stainless bolts, nuts, and washers. Optional separator mounting clips (SSUSC-U) with hardware are also available for mounting without drilling.

Tray Height	Separator Height	Alum	316 SS

8" (I8 only)	6.75"	AI8S-HA()	6I8S-HA

() = Blank for standard Zinc-Plated Hardware, (-6S) for 316 Stainless Steel or (-SB) for Silicon Bronze.

SEPARATORS

Mini Trim Edge Protector

**Separators for Vertical Bends**

Cable separators (dividers) for vertical bends must be factory formed to the proper radius needed. Vertical separators can be ordered to the specific degree of bend or the customer can order 90 degree separators and field cut them to the proper degree bends. Each separator is furnished with B-37 self-drilling self-tapping screws and one (CSS) separator splice. Stainless separators are furnished with stainless bolts, nuts, and washers. Optional separator mounting clips (SSUSC-U) with hardware are also available for mounting without drilling.

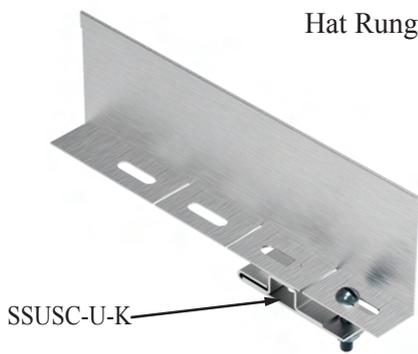

The following information is required for Vertical Separators:

1. Inside or Outside bend
2. Type of Material
3. Degree of Bend
4. Radius of Bend
5. Separator Height

Example: A3V-VI45-24

Tray Height	Separator Height	Alum	316 SS

 ( ) = Blank for standard Zinc-Plated Hardware, (-6S) for 316 Stainless Steel or (-SB) for Silicon Bronze.

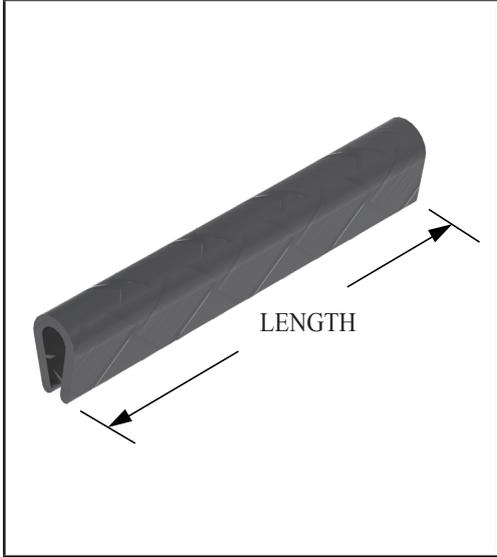

SPLICES AND MINI TRIM

**Separator Splice**

The CSS separator splice is applied to insure a smooth transition between barrier strips. The splice is a vinyl embossed extrusion with segmented metal core 5" long.

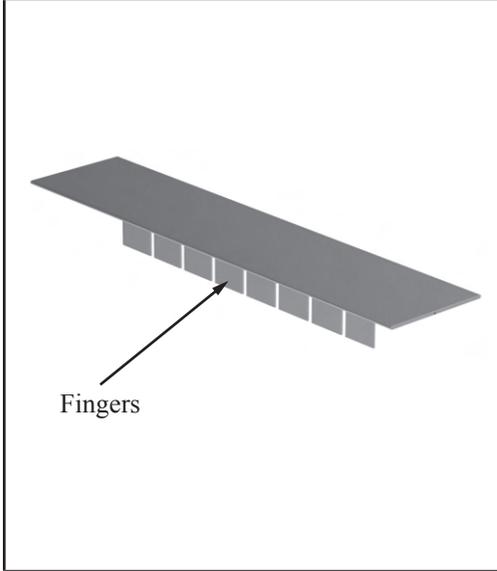

Catalog No.
CSS

**Mini Trim**

Mini Trim can be used as a protective edging to protect cables from sharp surfaces that they may contact. Mini trim is a vinyl embossed extrusion with segmented metal core that can be cut with a knife between the metal core segments. It will grip edges from 0.100" to 0.050" thick, and is supplied in 100 foot and 250 foot rolls.

Length	Catalog No.
100 ft	<b>MINI-TRIM-100</b>
250 ft	<b>MINI-TRIM-250</b>

**Bottom Splices for Ventilated or Solid bottom**

Finger splices are used to cover gaps between sections of ventilated trough or solid bottom trays and to prevent bottom edges from damaging cables as they cross the joints. These are especially useful on trays with flat solid bottoms or flat sheets mounted on top of rungs. Simply drop them in between tray bottoms and bend the fingers underneath in opposite directions to secure in place. Insert the tray width for "W".

Expansion Guide

**Hold Downs / Expansion Guides For I-Beam**

These heavy duty combination hold down clamps/expansion guides can be used in one orientation as a hold down clamp and flipped upside down to use as an expansion guide, eliminating the need to determine the exact number needed of each type before ordering. Designed for use on the outside flange of the tray. See NEMA VE-2 for information on installation. Uses 1/2" hardware, not included. See Detail "F" in Details on page 160.

**Hold Downs / Expansion Guides For I-Beam**

These special heavy duty tray hold down clamps and expansion guides are ideal for fastening trays to C-channels and beams such as those found on bridges. They are easy to install and reduce field labor costs since the beam clamp set screw eliminates the need to drill the C-channel or beam. Designed for use on the outside flange of the tray. See NEMA VE-2 for information on installation. For beams up to 1" thick. ( )=Blank for standard Zinc-Plated Hardware, (-6S) for 16 Stainless Steel

SUPPORT MATERIAL

HOLD DOWNS

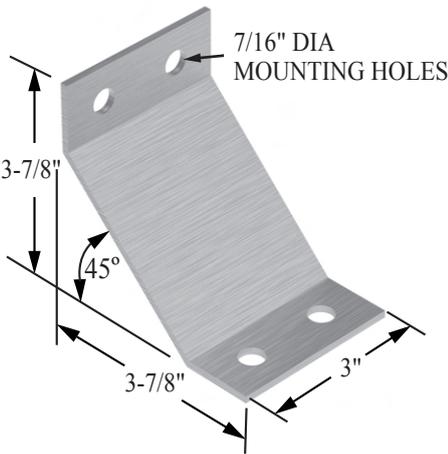

**Nylon Insulating Pads**

These nylon insulating pads are used under trays and hold down clamps or expansion guides to separate dissimilar metals and prevent corrosion. They are often used on steel supports to isolate an aluminum tray from sitting on the steel support. They also provide a smooth surface for trays to slide on during expansion and contraction. Uses 1/2" hardware, which is not included. Sold as each.

Dimensions: 1-5/8" Wide x 3-1/2" Long x 1/16" Thick  
9/16" Diameter Hole Center 1-1/4" from End

HANGERS

**I-Beam Tray Hanger Clips**

The tray hanger clip sets are used to hang an I-Beam tray (Except I6 & I8) by the side rails eliminating the need for a trapeze support. Includes top and bottom clamps. Use with 1/2" hanger rod only. Hanger rod, washers, and hex nuts need to be purchased separately. One set for one rail. See Detail "G" in Details on page 161.

SUPPORT MATERIAL

BEAM CLAMPS

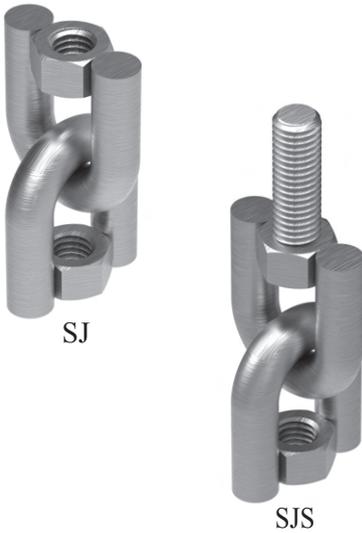

**Beam Clamps**

Beam clamps are heavy duty and have 1/2" holes to attach hanger rods to a beam flange or to support channels. Furnished in unfinished iron.

**Maximum allowable load:**  
1000 lbs.

Flange Thickness	Catalog No.
7/8"	SC-503
2"	SC-508

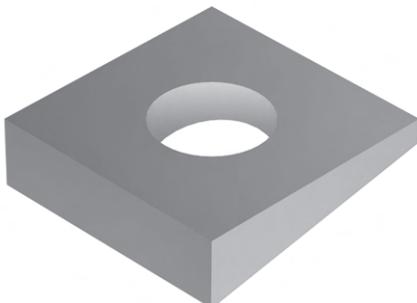

**Swivel Joints**

Swivel joints allow 1/2" hanger rods to swing from an inclined clamp. They are furnished with or without a 1" long stud assembly. The stud style can be mounted directly to a support angle.

**Maximum allowable load:**  
1500 lbs.

Item	Zinc-Plated	316 SS
Swivel Joint Only	SJ	6SJ
Swivel Joint with Stud	SJS	6SJS

**Bevel Washers**

The bevel washer is used when mounting to beams or channels to make a level bolting surface. The standard size is 1-1/4" square with a 1/2" bevel and a 9/16" hole for 1/2" hardware. Bolt and nut not included.

Catalog Number
W-11

BEAM CLAMPS

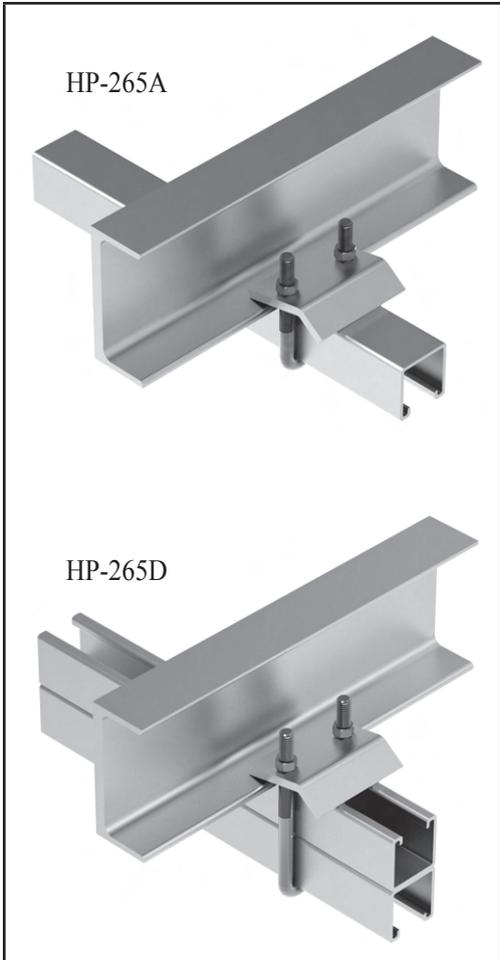

**Channel Clamps**

Channel clamp assemblies can be used on all American standard channels with a flange width of 3-1/4" or less. They are furnished for use with 1/2" diameter hanger rods in Zinc-Plated steel with or without a swivel joint.

Hanger rod not included.

**Maximum allowable load:**  
500 lbs. with a safety factor of 5

Item	Zinc-Plated

BRACKET ANGLES

**Bracket Angles**

Bracket angles connect two wall brackets, which then serve as a support for vertical runs. Cable trays are then bolted to the bracket angles with support angle clips. Bracket angles have a series of bolt slots to allow the attachment of various types of tray of the same width to the same bracket angle. Fabricated from HDGAF steel. Hardware is not included. See Detail "I" in Details on page 162.

**Aluminum Heavy-Weight Wall Brackets**

Heavy weight aluminum wall brackets are used to support long spans or multiple ladder or trough installations that exceed the load capacity of ordinary brackets. These are welded from structural aluminum channels with a stiffening member and 1-5/8" x 1-5/8" aluminum strut channel between the C-channels. The strut makes it easy to fasten the tray anywhere along the length of the bracket with spring nuts, hold down clips, and bolts that are not included. To develop the full strength of the bracket, (3) 1/2" diameter bolts must be used to mount the wall bracket. These aluminum wall brackets can be shipped quicker than the galvanized steel brackets.

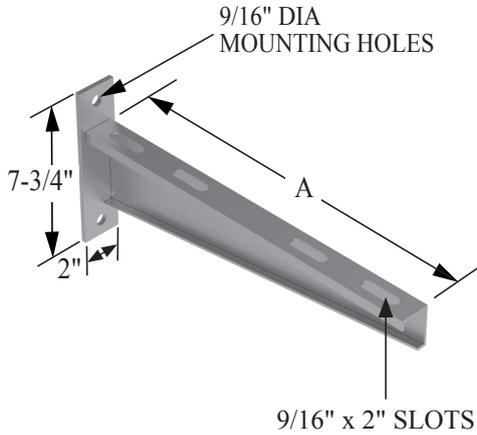

**Maximum allowable load:**

Load applied at two points: 1,000 lbs. per bracket (2.0 safety factor)  
 Load applied at end of bracket: 500 lbs. per bracket (2.0 safety factor)

WALL BRACKETS

**Medium-Weight Wall Brackets**

Medium-Weight wall brackets are used primarily to support two ladders side-by-side or one ladder over the other. They are made of 3/16" structural angle welded and hot dip galvanized. The horizontal support angle is continuously slotted to increase the versatility of the bracket. Top mounting slots are 9/16" x 1-1/2" and are spaced on 2" center. Hold down clamps must be purchased separately.

**Maximum allowable load:**

Load applied at two points: 1,200 lbs. per bracket.  
 Load applied at end of bracket: 600 lbs. per bracket.

49"	49"	31.5"	28.5"	<b>WBK-49M</b>

**Heavy-Weight Wall Brackets**

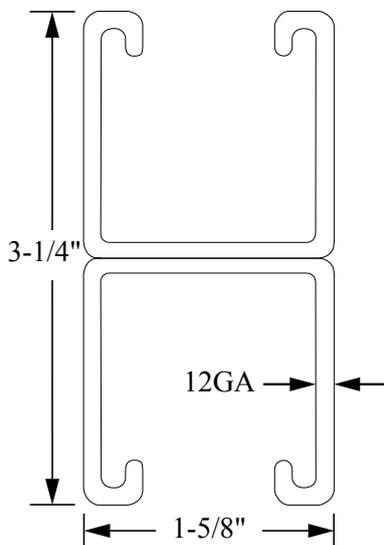

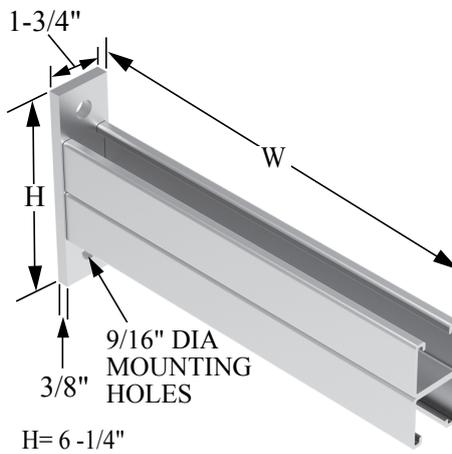

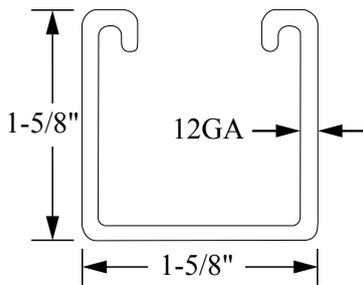

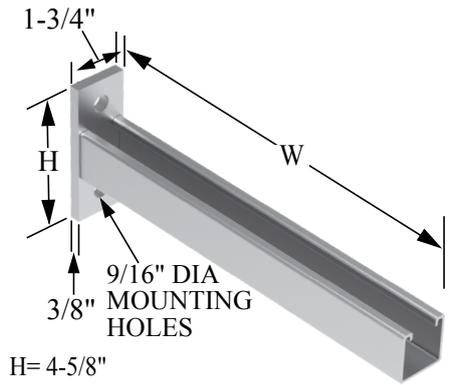

Heavy-Weight channel-type wall brackets are used to support long spans or multiple ladder or trough installations that exceed the load capacity of ordinary brackets. They are constructed with two 3" structural channels with 1-5/8" x 1-5/8" strut between them providing a continuous slot for fastening trays anywhere. They have a stiffener and are hot dip galvanized. To develop the full strength of the bracket, three 1/2" diameter bolts (*not included*) must be used with the pre-drilled holes in the bracket. Hold down clamps and hardware must be purchased separately.

**Maximum allowable load:**

4,000 lbs. when applied as 2 equally concentrated loads, spaced at least 2' - 4" apart on brackets 5' wide and under; or at least 4' - 6" apart on brackets over 5' wide. End load would be 2,000 lbs.

WALL BRACKETS

**Single & Double Strut Wall Brackets**

Designed primarily for use with framing, these brackets will work well in other applications. The uniform load shown represents a 2.5 safety factor. Furnished in HDGAF steel. Hold down clamps must be purchased separately. See Detail "I" and "O" in Details on pages 162 and 165.

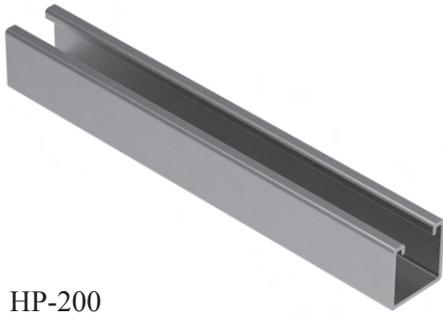

**Maximum concentrated end load:**

One-half the listed uniform load.

**Strut-Type Support Channel**

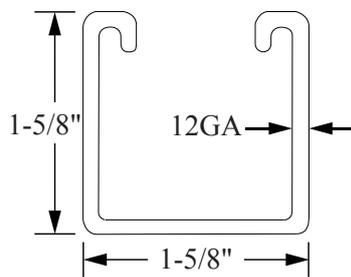

Strut channels provide indirect support for hanger rods by spanning between available structural support beams and channels. The strut is supplied in 10' or 20' lengths and can be easily field cut to the lengths needed for use as a trapeze-type support. Available in single or double back-to-back configurations, as well as slotted or with round holes.

C-PORT C-SERIES ROOF BLOCKS

**C-Series Roof Blocks**

C-Series Supports are 100% recycled rubber, UV resistant and suitable for installation on most types of roofing material or other flat surfaces. Each C-Series Support has a 1-5/8" x 13/16" high, 14 gauge pre galvanized strut on top, making it easy to mount cable tray or piping. They are 4-7/8" high by 6" wide and are offered in lengths from 9.6" to 48".

C-SERIES ROOF BLOCKS					
Cat. No.	Height (H)	Width (W)	Length (L)	Weight	Max Load
C10	4.875" (124 mm)	6" (152 mm)	9.6" (244 mm)	5.30 lbs.	750 lbs.

C48	4.875" (124 mm)	6" (152 mm)	48.0" (1219 mm)	27.12 lbs.	3750 lbs.

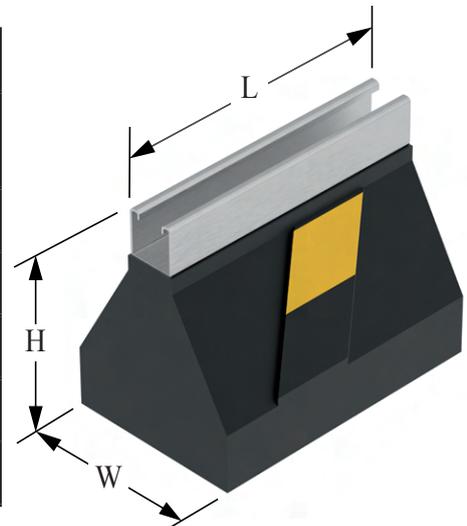

C-PORT C510 & C6-SERIES ROOF BLOCKS

**C510 & C6-Series Roof Blocks**

C510 & C6-Series Supports are 100% recycled rubber, UV resistant and suitable for installation on most types of roofing material or other flat surfaces. Each C510 or C6-Series Support has a 1-5/8" x 1-5/8" high, 14 gauge pre galvanized strut on top and provides additional support for tray, piping or other applications. The C6-Series is applicable where building codes require pipes to be at least 6" above the roof surface.

C510 & C6-ROOF BLOCKS					
Cat. No.	Height (H)	Width (W)	Length (L)	Weight	Max Load

SUPPORT MATERIAL

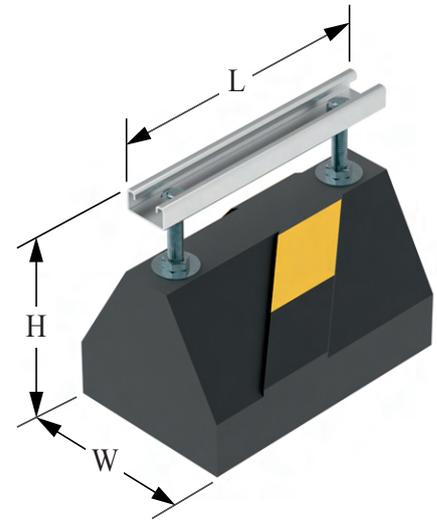

C-PORT CE10-SERIES ROOF BLOCKS

**CE10-Series Roof Blocks**

CE10-Series Supports are 100% recycled rubber, UV resistant and suitable for installation on most types of roofing material or other flat surfaces. Each CE10-Series Support has a 1-5/8" x 13/16" high, 14 gauge pre galvanized strut mounted on top of two 1/2" diameter electro-plated zinc threaded rod risers, making it easy to mount cable tray or piping at the desired height. Base is 4" high by 6" wide and 9.6" long and is offered in lengths of 9.6".

CE10-SERIES ROOF BLOCKS					
Cat. No.	Height (H)	Width (W)	Length (L)	Weight	Max Load
CE10-8	8" (203 mm)	6" (152 mm)	9.6" (244 mm)	6.14 lbs.	400 lbs.

DETAILS

Detail A: Standard Splice

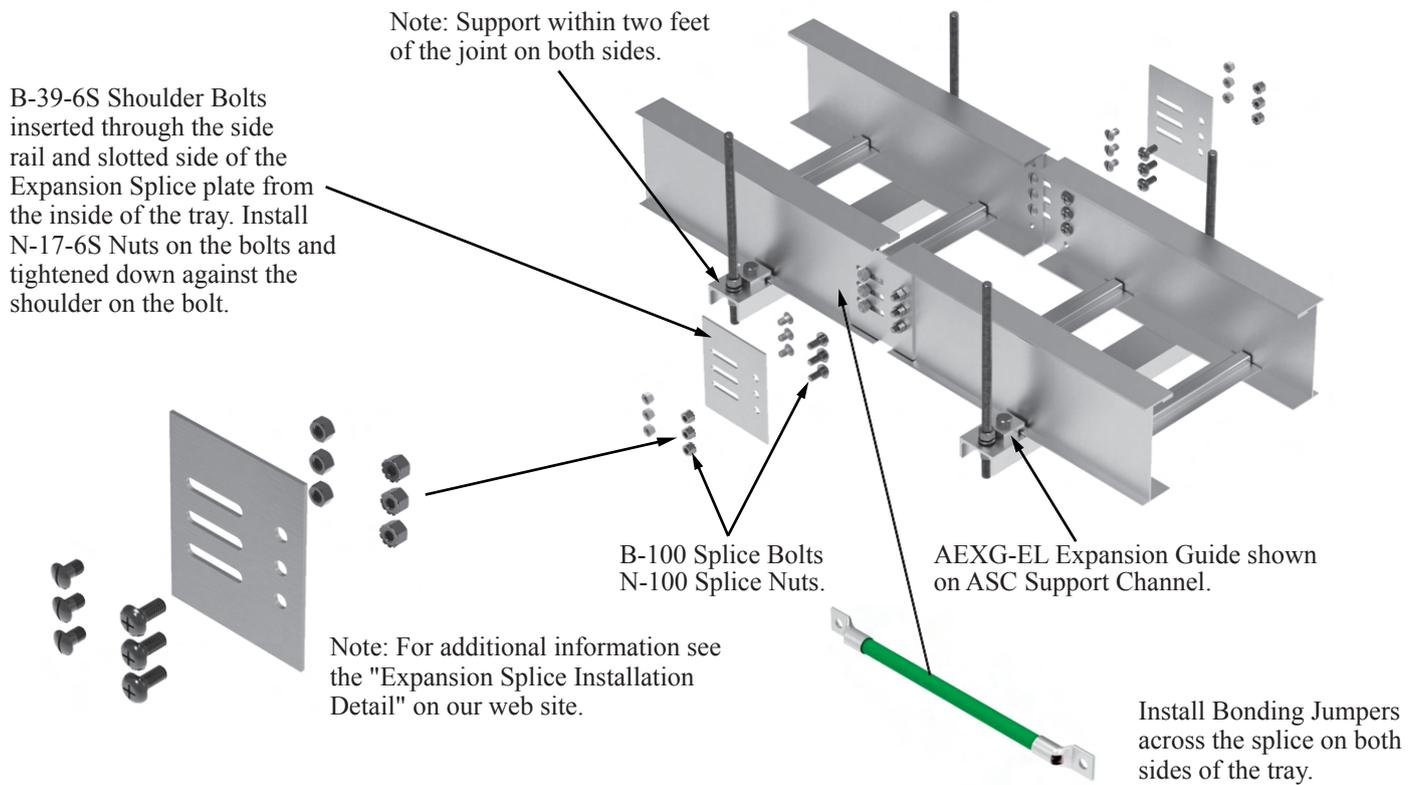

AHDC-A Hold Down Clamp on ASC Support Channel shown.

Note: Trays often have end holes that are not used by the splice plates.

B-100 Splice Bolts are inserted through the side rail from the inside of the tray. The splice plates are located on the outside of the tray and N-100 Splice Nuts are installed on the bolts and tightened until the bolt heads pull down flush on the inside of the tray.

Detail B: Expansion Splice

Note: Support within two feet of the joint on both sides.

B-39-6S Shoulder Bolts inserted through the side rail and slotted side of the Expansion Splice plate from the inside of the tray. Install N-17-6S Nuts on the bolts and tightened down against the shoulder on the bolt.

B-100 Splice Bolts  
N-100 Splice Nuts.

AEXG-EL Expansion Guide shown on ASC Support Channel.

Note: For additional information see the "Expansion Splice Installation Detail" on our web site.

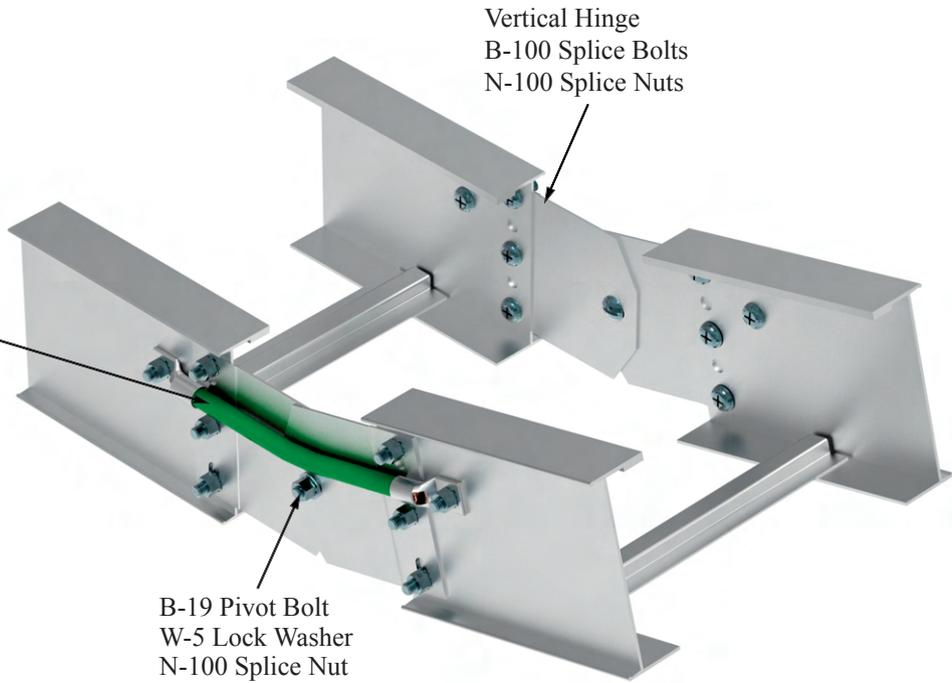

Install Bonding Jumpers across the splice on both sides of the tray.

**DETAILS**

**Detail C: Vertical Hinge**

Hinge Splices should be supported within two feet of the joint on both sides.

Bonding Jumpers should be installed on both sides of the tray.

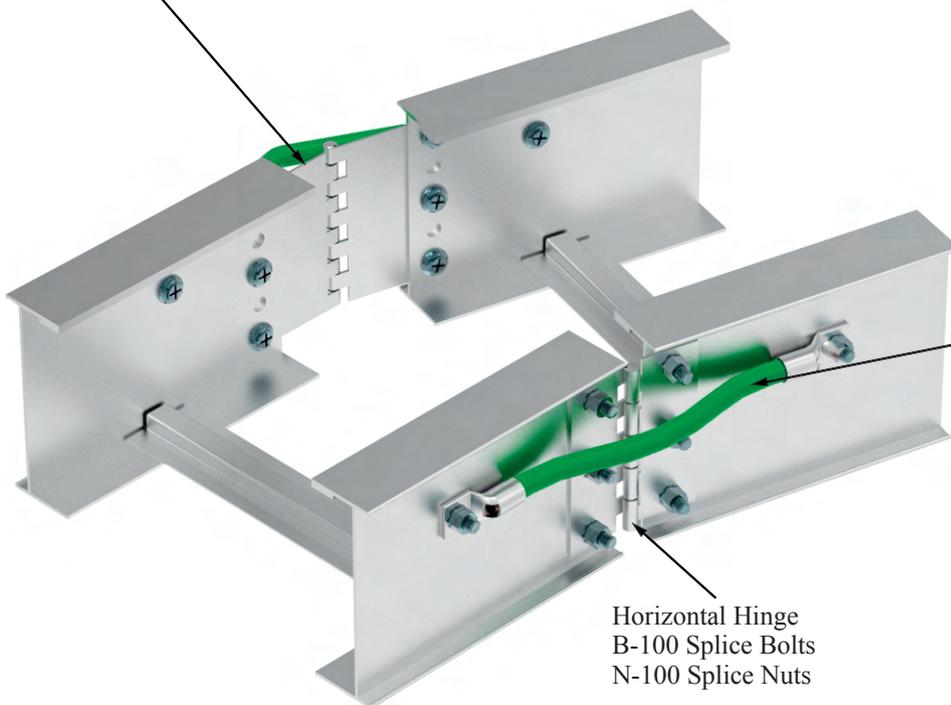

Vertical Hinge  
B-100 Splice Bolts  
N-100 Splice Nuts

B-19 Pivot Bolt  
W-5 Lock Washer  
N-100 Splice Nut

**Detail D: Horizontal Hinge**

Long Horizontal Hinge is field drilled once the angle is fixed.

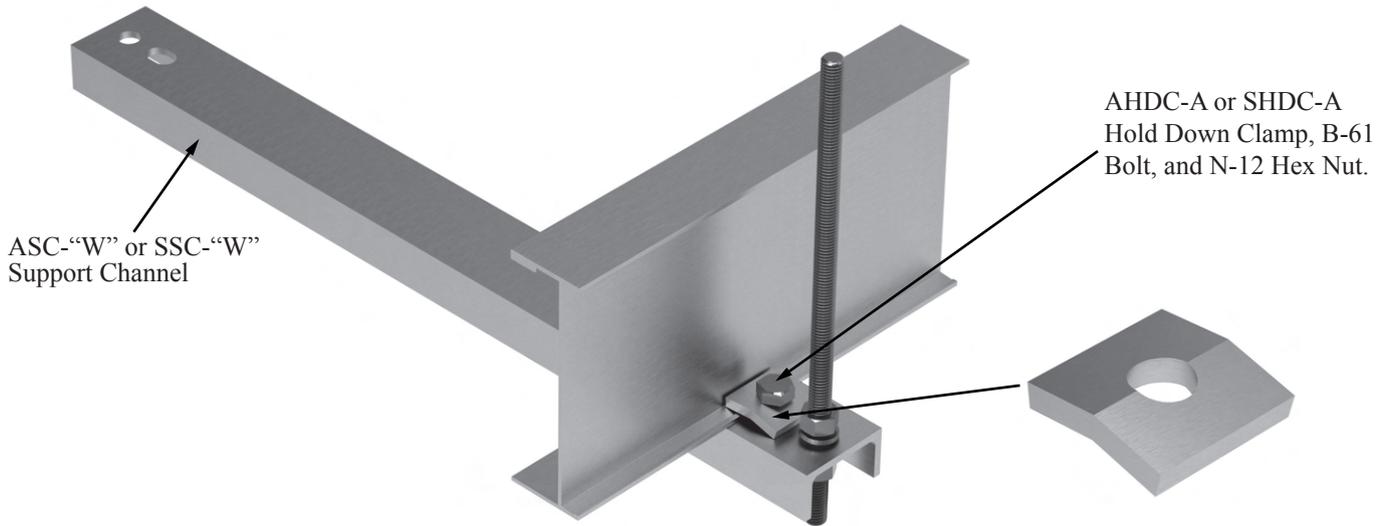

Hinge Splices should be supported within two feet of the joint on both sides.

Bonding Jumpers should be installed on both sides of the tray. Angles over 30 degrees may require a 16" long Bonding Jumper across the outside hinge. 12" Bonding Jumpers will work across the inside hinge.

DETAILS

Detail I: SRSA & Wall Brackets Riser Detail

Detail J: ASC-U Structural Connector

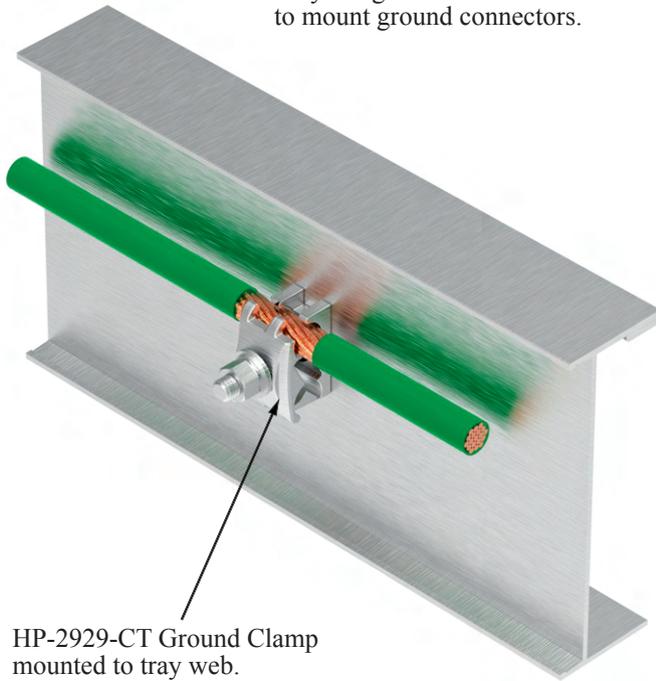

ASC-U or SSC-U Structural Connectors can be used to fasten trays to floors, walls or cabinets and boxes. They mount to the splice holes of a cable tray and use a single 1/2" diameter bolt to fasten to the other structure. Sold in single units so two units are required to make a connection.

DETAILS

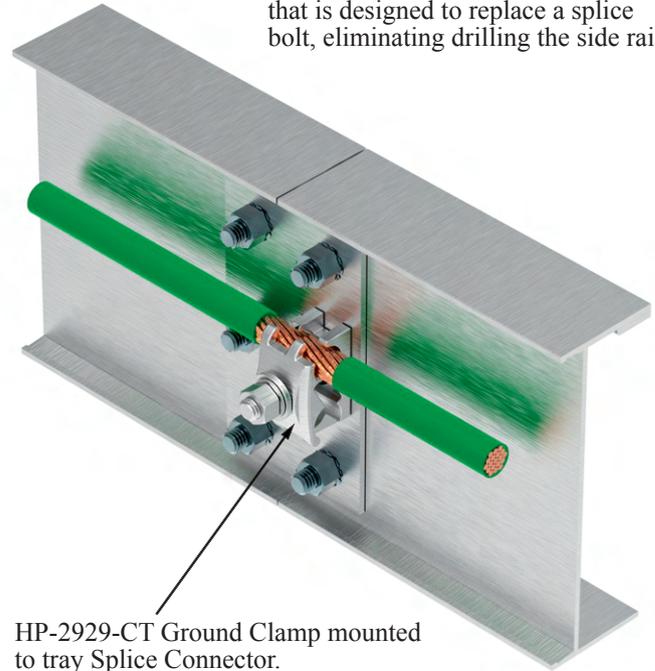

**Detail K: HP-2525-CT, HP-2626-CT & HP-2929-CT Ground Clamp Details**

Tray flanges should never be drilled to mount ground connectors.

This ground clamp comes with a bolt that is designed to replace a splice bolt, eliminating drilling the side rail.

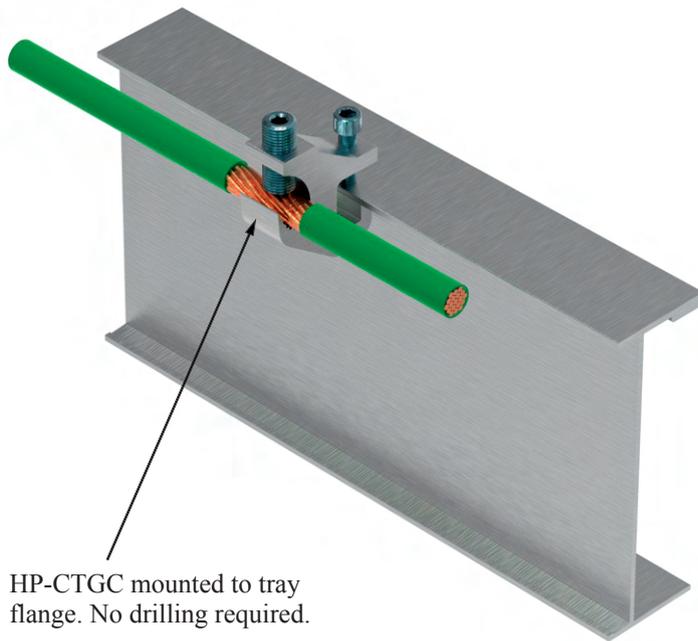

HP-2929-CT Ground Clamp mounted to tray web.

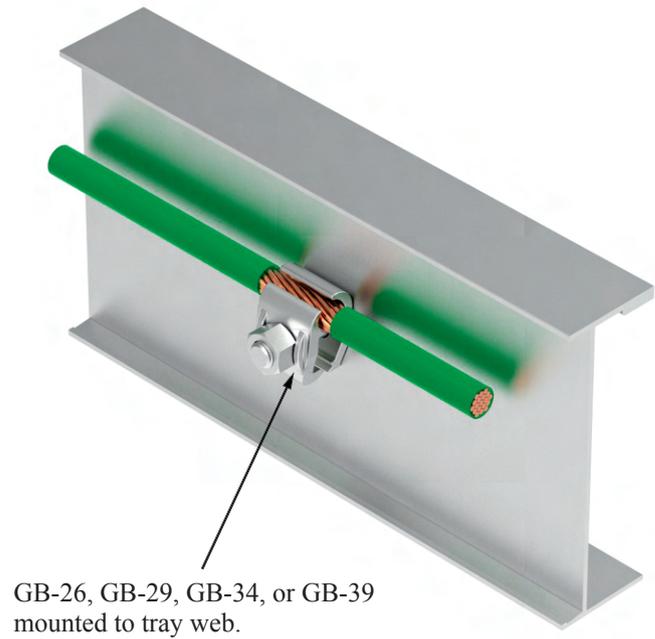

HP-2929-CT Ground Clamp mounted to tray Splice Connector.

**Detail L: HP-CTGC, GB-26, GB-29, GB-34 & GB-39 Ground Clamp Details**

HP-CTGC mounted to tray flange. No drilling required.

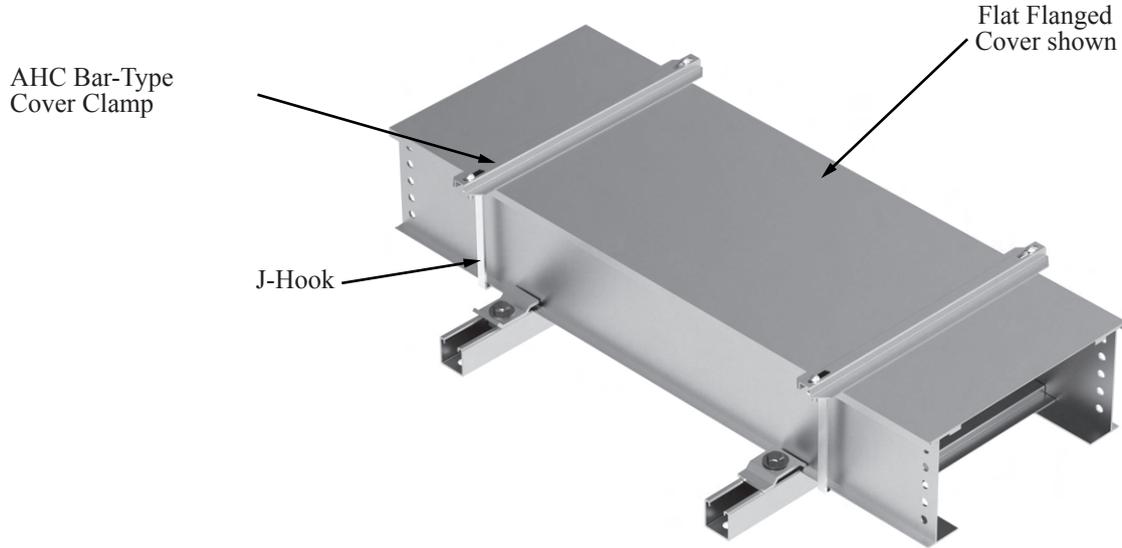

GB-26, GB-29, GB-34, or GB-39 mounted to tray web.

The installations above show proper installation where the copper wire does not come in direct contact with the aluminum cable tray. Tray and cable contact is through a Tin-Plated connector. Oxidation Inhibitor (O.I.) can be used on connections.

- (1) 24" Long Cover
- (2) Wall Connectors With (6) B-100 Bolts & (6) N-100 Nuts For Each Connector
- (2) Splice Plates With (6) B-100 Bolts & (6) N-100 Nuts For Each Splice Plate
- (8) B-26 Self Drilling Self Taping Sheet Metal Cover Screws

Insert the Pan through the hole in the wall. Place a Wall Connector over each end of the tray and slide against the wall. When wall Connectors are in position mark the holes on the side of the pan. Field drill the mounting holes for mounting the Wall Connectors to the Pan. Mount wall connectors to wall (*hardware NOT included*). Attach trays to the ends of the Pan using Splice Connectors to continue the runs on both sides of the wall. Install cables and then put the covers on the pan with the Self-Drilling Screws.

Note: Hardware quantity shown based on 6" High Tray

**I-BEAM LADDER SPECIFICATION**

**1.0 Specification for Aluminum I-Beam Ladder**

**2.0 General**

- 2.1 Cable tray systems shall be of the design of one manufacturer and shall be designed so that there are no burrs, projections, or sharp edges to damage cable insulation.
- 2.2 Fittings shall have the same load-carrying capacity as straight sections. Fittings shall be of the continuous arc type with a 12, 18, 24, 36, or 48-inch radius, unless otherwise shown on the drawings.
- 2.3 Ladder type tray straight sections shall be 10' - 0", 12' - 0", 20' - 0", or 24' - 0" long and shall be of the width indicated on the drawings to provide the planned cable capacity.

**3.0 Material and Construction**

- 3.1 Ladder-type cable tray longitudinal members shall be 4-1/2", 5", 6", 7", or 8" deep extruded aluminum I-Beam construction of 6063-T6 aluminum alloy.
- 3.2 Transverse members (rungs) shall be of extruded aluminum alloy 6063-T6 and shall be designed to prevent collection pockets for moisture or contaminant materials.
- 3.3 Transverse members (rungs) shall be clinched and/or welded to the side rails. Transverse members shall be located on 6", 9", 12", or 18" spacing.

**4.0 Splice Joints**

- 4.1 Resistance across any splice connection shall not exceed 330 microhms.
- 4.2 Splice connector design shall be universal for use on straight sections and fittings.
- 4.3 Splice connectors shall be of the high pressure bolted type with a minimum of four bolts per connector.

**5.0 Loading**

- 5.1 Ladder-type cable tray shall have a load safety factor of 1.5 based on the destruction load capacity as defined within NEMA Standard VE-1.
- 5.2 The ladder-type cable tray shall meet or exceed the following NEMA load classification:

8A (50 lbs per ft/8 ft span)	16A (50 lbs per ft/16 ft span)
8B (75 lbs per ft/8 ft span)	16B (75 lbs per ft/16 ft span)
8C (100 lbs per ft/8 ft span)	16C (100 lbs per ft/16 ft span)
12A (50 lbs per ft/12 ft span)	20A (50 lbs per ft/20 ft span)
12B (75 lbs per ft/12 ft span)	20B (75 lbs. per ft/20 ft span)
12C (100 lbs per ft/12 ft span)	20C (100 lbs per ft/20 ft span)

**6.0 UL**

- 6.1 The cable tray system shall be classified for use as an equipment ground and requires that the minimum cross-sectional area be shown on the tray labels. The industry standard is to mark each straight section and fitting with its own cross-sectional area. It is the responsibility of the installer and/or user to assure that the capacity of the overall system is adequate to meet the anticipated ground fault of the system.

**7.0 Manufacture and Data**

- 7.1 The following data shall be provided with the quotation:
  - (a) Simple beam load and deflection tables
  - (b) Drawings illustrating tray quoted and splice connection
- 7.2 Tray shall be manufactured in accordance with, and by a member of, NEMA VE-1.

**8.0 Installation**

- 8.1 Tray shall be installed in accordance with NEMA VE-2.

## I-BEAM TROUGH SPECIFICATION

**1.0 Specification for Aluminum I-Beam Trough****2.0 General**

- 2.1 Cable tray systems shall be of the design of one manufacturer and shall be designed so that there are no burrs, projections, or sharp edges to damage cable insulation.
- 2.2 Fittings shall have the same load-carrying capacity as straight sections. Fittings shall be of the continuous arc type with a 12, 18, 24, 36, or 48-inch radius, unless otherwise shown on the drawings.
- 2.3 Trough-type tray straight sections shall be 10' - 0", 12' - 0", 20' - 0", or 24' - 0" long and shall be of the width indicated on the drawings to provide the planned cable capacity.

**3.0 Material and Construction**

- 3.1 Trough-type cable tray longitudinal members shall be 4-1/2", 5", 6", 7", or 8" deep extruded aluminum I-Beams of 6063-T6 aluminum alloy.
- 3.2 The transverse members (rungs) shall be of extruded aluminum alloy 6063-T6.
- 3.3 Trough bottom inserts shall be made of the following types: Corrugated, Bump Bottom, & Flat Sheet-type.

**3.4 Trough Bottom Construction Methods**

- (a) Ventilated & solid trough bottom shall be constructed with transverse members (rungs) and bottom inserts (Corrugation, Bump & Flat Sheet) between the transverse members & on each end of the trough. The transverse members shall be located on 12" spacing. Transverse members shall be clinched and/or welded to the side rail. The bottom inserts shall be made of aluminum and shall be attached to the bottom flange of the I-Beam shaped longitudinal member by means of clinching or welding at a minimum of 2 places per side of the bottom inserts (one on each end of each side).
- (b) Ventilated trough bottom shall be constructed with transverse members (rungs). The transverse members shall be located on 4" spacing. Transverse members shall be clinched and/or welded to the side rail.

**3.5 Ventilated & Solid Trays Types**

- (a) Solid Trough (Corrugated): Construction method (a) for widths of 6" - 24" wide
- (b) Solid Trough (Bump): Construction method (a) for widths of 6" - 36" wide
- (c) Solid Trough (Flat): Construction method (a) for widths 6" - 36" wide
- (d) Ventilated Trough (Corrugated): Construction method (a) for widths of 6" - 24" wide
- (e) Ventilated Trough (Flat): Construction method (a) for widths of 6" - 36" wide
- (f) Ventilated Trough (4" Rung Spacing): Construction method (b) for widths of 6" - 36" wide

**4.0 Splice Joints**

- 4.1 Resistance across any splice connection shall not exceed 330 microhms.
- 4.2 Splice connector design shall be universal for use on straight sections and fittings.
- 4.3 Splice connectors shall be of the high pressure bolted type with a minimum of four bolts per connector.

**I-BEAM TROUGH SPECIFICATION**

**5.0 Loading**

5.1 Trough-type cable tray shall have a load safety factor of 1.5 based on the destruction load capacity as defined within NEMA Standard VE-1.

5.2 The trough-type cable tray shall meet or exceed the following NEMA load classification:

8A (50 lbs per ft/8 ft span)	16A (50 lbs per ft/16 ft span)
8B (75 lbs per ft/8 ft span)	16B (75 lbs per ft/16 ft span)
8C (100 lbs per ft/8 ft span)	16C (100 lbs per ft/16 ft span)
12A (50 lbs per ft/12 ft span)	20A (50 lbs per ft/20 ft span)
12B (75 lbs per ft/12 ft span)	20B (75 lbs per ft/20 ft span)
12C (100 lbs per ft/12 ft span)	20C (100 lbs per ft/20 ft span)

**6.0 UL**

6.1 The cable tray system shall be classified for use as an equipment ground and requires that the minimum cross-sectional area be shown on the tray labels. The industry standard is to mark each straight section and fitting with its own cross-sectional area. It is the responsibility of the installer and/or user to assure that the capacity of the overall system is adequate to meet the anticipated ground fault of the system.

**7.0 Manufacture and Data**

7.1 The following data shall be provided with the quotation:

- (a) Simple beam load and deflection tables
- (b) Drawings illustrating tray quoted and splice connection

7.2 Tray shall be manufactured in accordance with, and by a member of, NEMA VE-1.

**8.0 Installation**

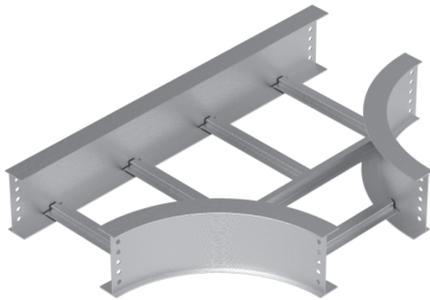

8.1 Tray shall be installed in accordance with NEMA VE-2.

## Cable Tray Systems

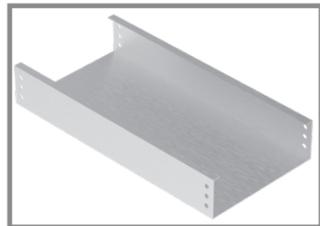

Engineered to Support Powerful Reputations

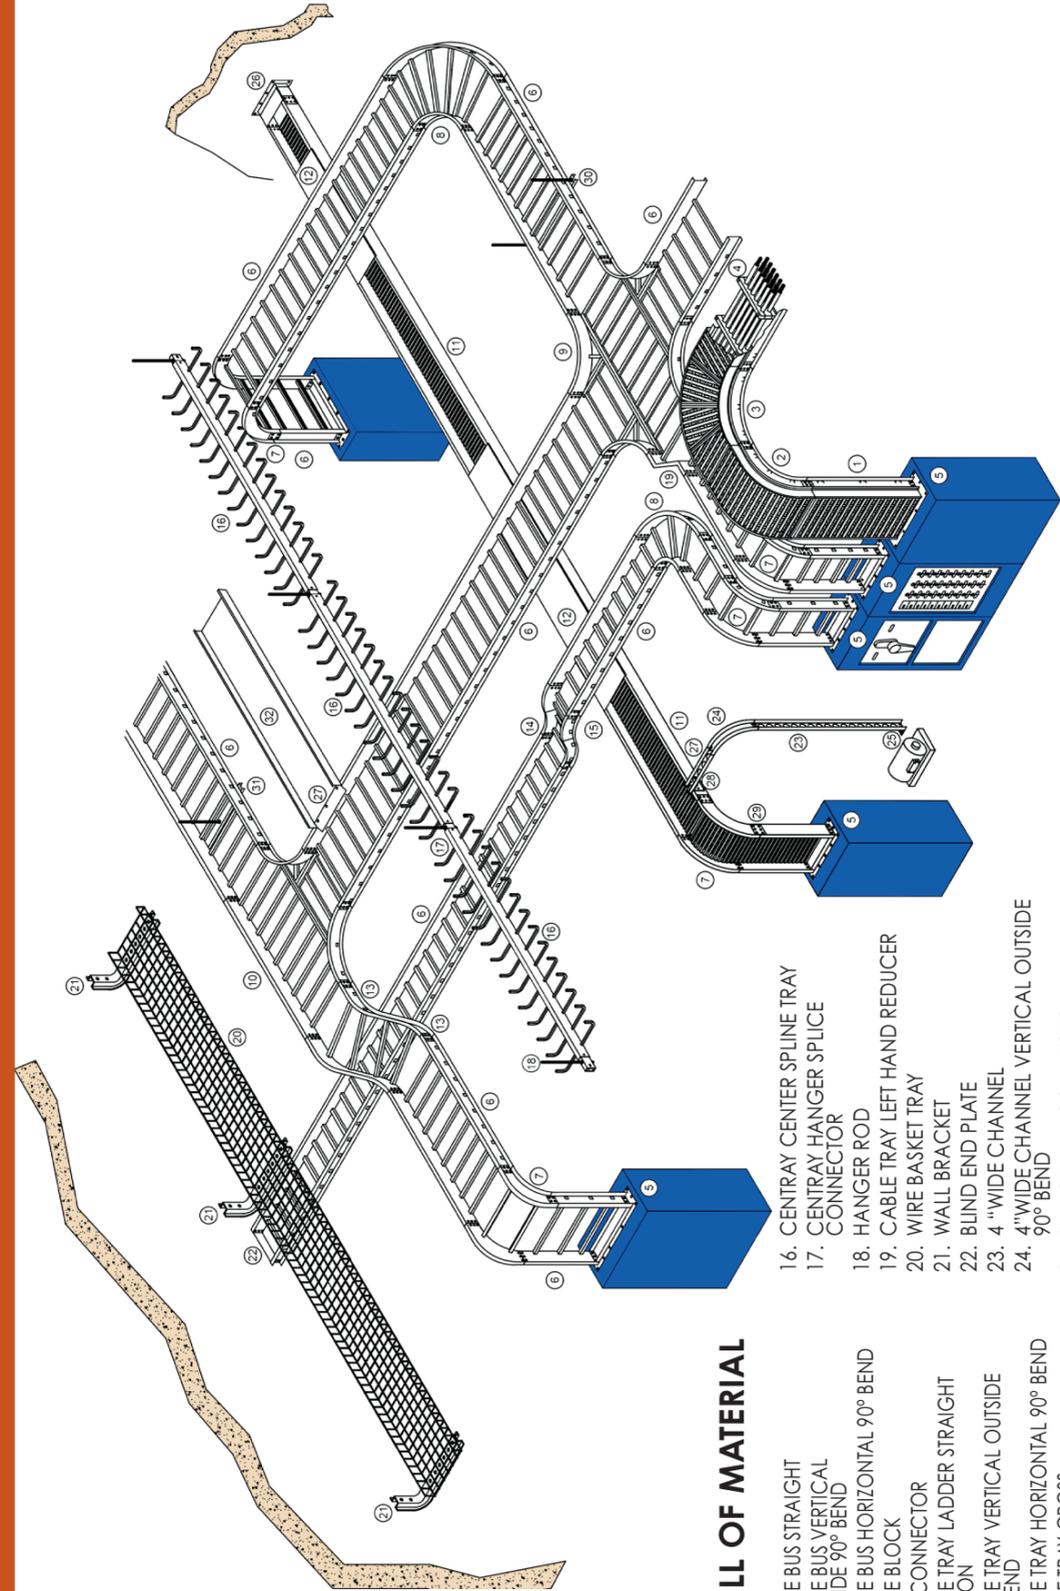

MP Husky was founded in 1952 and originally began operations as Husky Products. Over the following 60+ years of leadership and service MP Husky has gone through several transformations and mergers, including Husky/Burndy and Metal Products, thus leading to what is today MP Husky—America's leading manufacturer of Cable Tray and Cable Bus Power Distribution Systems.

Throughout these changes one thing has remained constant—the Husky drive to be the most reliable, highest quality, cost effective and innovative manufacturer of Cable Support Systems and Cable Bus Power Distribution Systems. We have an unsurpassed commitment to customer satisfaction and service, and we are eager to earn your loyalty and trust. As we continue to build and strengthen our partnerships with our customers we look forward to the next years of service and support.
